# 1. Introduction

## 1.1 First Language acquisition

"Our genetic endowment makes it possible to learn any human language." (Guasti, 2002:18) How can it happen? Through UG (*Universal Grammar*). Every human being has an innate instinct to acquire a language in a short period of time, any language in the world. Chomsky, the pioneer of the *Nativist Theory*, argues that this instinct is *Universal Grammar*, which allows us to acquire a language despite the insufficient exposure to it and without any explicit teaching.

UG is composed of *principles and parameters*. The *principles* code the universal properties common to all languages in the world, while the *parameters* code the properties specific of each language and are set on the basis of the child's experience.

According to this approach, language is a cognitive ability that works quickly and in the same way for both oral and signed languages. The unconscious process of language acquisition will give its best results only if it happens during the *critical period*, which ends around puberty. In this period, the skills to acquire language are at their highest peak and Lenneberg (1967) suggests that only if a language is acquired during this period, it can fully develop. This is confirmed by those cases of children that have not been exposed to linguistic input until their adolescence.

The Nativist Theory is not the first theory regarding the acquisition of language. Until 1960, the most successful approach was the *Behavioral Theory*, according to which language is acquired through imitation or through the relation between stimulus and answer. Nowadays, this approach is considered obsolete, but there is still a debate between the nativist vision and the *Cognitive-functional Theory*. This last theory suggests that an innate predisposition to acquire a

language exists but it is not enough to the acquisition process, also other general mechanisms intervene in language acquisition because the child does not have a specific ability to uniquely elaborate the linguistic input. Finally, the *Emerging Theory* proposes that grammatical principles are not biological, but they arise as a solution to specific problems of human beings, as communicating to other people a huge amount of messages with a limited cognitive system.

In my work, I will follow the nativist approach, which is widely accepted by the linguist community.

## 1.2 Subject of the work

This work is focused on bilingual first language acquisition. For my research, I took 3 children into consideration, namely Sara, Pietro and Marco. Sara is a monolingual child speaking Italian, she lives in Venice, and she was recorded from 22 to 28 months by Ambrosi (2007). Pietro is a bilingual child speaking Italian and the Dialect of Cittadella (a small town close to Bassano del Grappa). He was recorded by Cecchin (2009) from 19 to 27 months, and the last recording was made later when he was 34 months old. Pietro lives in a bilingual context, where his interlocutors speak both Italian and Dialect. Marco is a bilingual child speaking Italian and the Dialect of Rosà, a small town close to Bassano del Grappa, where he lives. He was recorded by Fabris (2010) from 24 to 36 months.

I analysed the productions of the three children following the *Ivy Hypothesis* (Bernardini and Schlyter, 2004). This theory suggests that bilingual speakers have one *Stronger Language* and a *Weaker* one, which seems to grow on the structure of the stronger language like ivy.

Then I focused my attention on the acquisition of the copula analysing the productions in Italian, the Dialect and mixed utterances. I observed omissions from a longitudinal perspective, both in declarative sentences and in WH sentences and in different semantic types of copular sentences, and agreement between the copula and the subject. Finally, I analysed the production of the article in the copular structures.

## **1.3 Organization of the work**

This work is divided into six chapters. Chapter two analyses the *Ivy Hypothesis* applied to my children's data, chapter three is a description of the morphology and the distribution of the copula in Italian, in Cittadella's Dialect and the Dialect of Rosà. Chapter four and five are devoted to the acquisition of the copula. In Chapter four, I will provide a description of previous studies about the copula, and the analysis of the monolingual Italian child Sara, whereas chapter five is focused on Pietro and Marco. Chapter six contains the conclusions of my work.

## **1.4 Research and data collection**

I have used the transcriptions of Sara and Marco's spontaneous productions available at the Department of Linguistics and Comparative Cultural Studies. In Ambrosi (2007) I found the linguistic productions of Sara, and in Fabris (2010) the productions of Marco. In the case of Pietro, the Cittadella Dialect speaker, I had no access to his corpus and based my analysis on the data reported in Cecchin (2009).

## **1.5 Methodological problems**

During my research, I found some difficulties in the analysis of Marco's corpus when I had to divide his productions into Italian, Dialect, and mixed utterances (Italian and Dialect in one and the same sentence). This operation was not easy because the two languages are not very different from a lexical point of view. Another problem was how to consider the mixed productions, because they were very few and not enough to determine a trend. I have therefore decided to describe them from a longitudinal perspective, and not to consider them the detailed analysis of the acquisition of the copula.

I found Franchi's articles (2004, 2006) unclear at some points: at the beginning it is not pointed out if the contexts that are reported are declaratives and interrogatives together or just declaratives.

# 2. The Ivy Hypothesis

## 2.1 Introduction

In this chapter I will describe the "Ivy Hypothesis" formulated by Bernardini and Schlyter (2004). The hypothesis suggests that there is a peculiar sentence-internal code-mixing in the productions of those children who are bilingual but develop the two languages unevenly. This happens because they have a *Stronger language* and a *Weaker one*.

Bernardini and Schlyter (2004) observed that bilingual children who have an uneven lexical development have one language that is stronger than the other one. They observed the code-mixed utterances produced by three bilingual children and noticed that "the mixing serves as a gap filler" (Bernardini and Schlyter 2004, p. 49), because they use lexical items from the Stronger Language when they do not have them in the Weaker one. It seems that the structural tree of the Stronger Language is the pillar on which the structural tree of the Weaker Language grows. Hence the name: *Ivy Hypothesis*.

The Minimalist Program and more specifically the generative syntax model is the theoretical base for this hypothesis and explains the relation made in the article between lexicon, code-mixing, input and syntactic development. The following points summarize this relation:

- Syntax is projected from the lexicon (Chomsky 2005, in Bernardini and Schlyter 2004)
- Syntactic development in L1 acquisition can be viewed as lexical instantiation of syntactic categories from the bottom up (Clahsen, Eissenbeiss and Penke 1996, Grimshaw 1994, in Bernardini and Schlyter 2004)

- Bilinguals have one universal syntax and two lexicons (MacSwan 2000, in Bernardini and Schlyter (2004))
- Bilingual children with uneven development have one richer and one poorer lexicon; the difference in the amount of lexicon is related to a difference in the input (Huss 1991, in Bernardini and Schlyter 2004)

Therefore bilingual children with unequal development project more syntactic structure in their Stronger Language than in their weaker one (Bernardini and Schlyter 2004, p. 50).

The Ivy Hypothesis predicts some properties of code-mixing such as: elements of the lower portions of the tree are lexically instantiated in the Weaker Language, whereas elements of the higher portions are realized in the Stronger Language (Bernardini and Schlyter 2004, p. 50).

In the following sections, I will establish for each child, which language is the Stronger and which one is the Weaker calculating their MLU (Mean Length of Utterance).

## 2.2 MLU

In order to determine the Stronger Language and the Weaker one, Bernardini and Schlyter (2004) calculated the MLU (Mean Length of Utterance): they counted all the words produced and divided them for the number of sentences.

I divided all productions of each child into three different groups: Italian, Dialect and Mixed; in this way I could calculate the MLU for every language. In the mixed group, I calculated two different MLUs: one for Italian, dividing all the Italian words for the total number of utterances; and one for the Dialect, dividing all the Dialect words for the number of mixed sentences. This value allows me to understand which language is the dominant one since Bernardini and Schlyter (2004) suggest that a bilingual child produces longer sentences when he or she uses the Stronger Language.

As I have already said in section 1.6 (Methodological problems), it was not easy to isolate the 3 different categories either because both the Dialects of Cittadella (Pietro) and Rosà (Marco) are very similar to Italian (see examples (1) and (2) taken from Cecchin 2009), or because children, especially when they are younger, omit some phonemes fundamental for the identification of the language.

- 1) ITALIAN: ancóra, signóra. DIALECT: ancòra, signòra. (*Again, lady*)
- 2) ITALIAN: nonna, nonno. DIALECT: nona, nono. (*Grandmother, grandfather*)

For the classification of the produced words, I followed the guidelines used by Cecchin (2009):

- a) The repetition of a word in the same utterance was only counted until three times unless it had a particular meaning in the sentence;
- b) The only restriction in counting a word concerned "sì" (*yes*) and "no" (*no*), which was only counted if they were part of the sentence, but not if they were in isolation;
- c) All other words were counted;
- d) The production of noises or other non lexical expressions was counted as a single word;
- e) Cut off words were counted;
- f) Babbled words were counted as a single word;
- g) The words which in Italian have a double consonant and in Dialect are pronounced with one consonant were counted as Dialect if the consonant was clearly not geminate. If it was not clear, they were counted as Italian;
- h) Words which are identical in Italian and Dialect were all counted as Italian;
- i) Pietro's phonological inventory lacks the lateral "l". It only appears in the last recordings. Many Italian words which have "l" are identical to their Dialect counterparts except for the "l" pronunciation which in Dialect is often of the "schwa" quality. So the production of these words is most of the times more similar to the Dialect version. In my work I counted them as Dialect;
- j) Exclamation and swearwords which are typical of Dialect tradition were counted as Dialect;

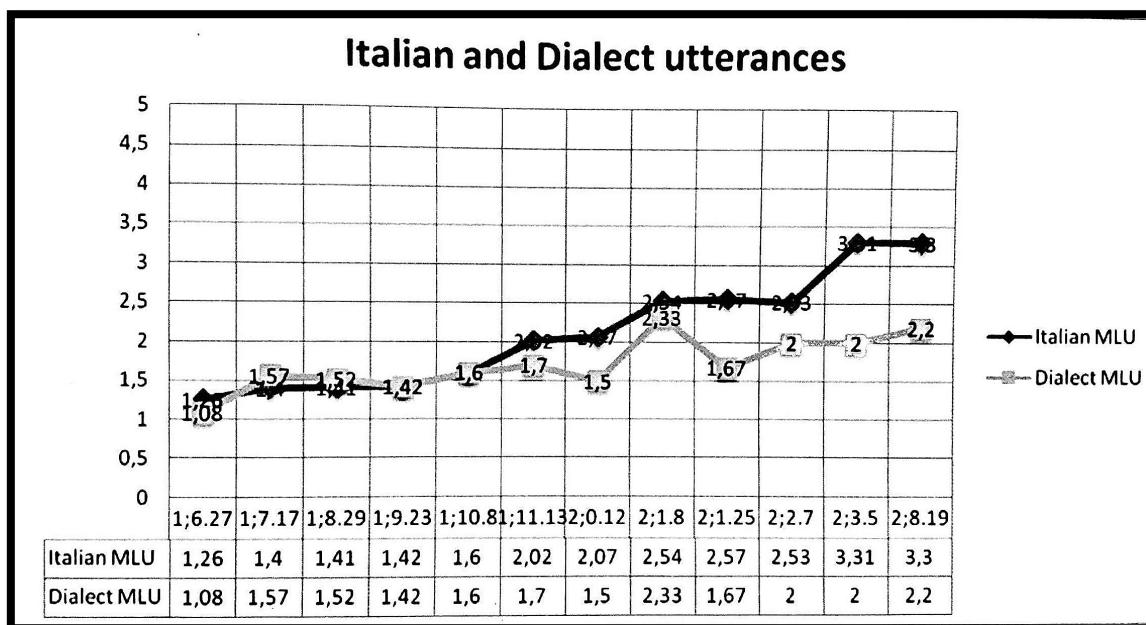

- k) Words which are written in the same way in both languages but pronounced for instance with an open vowel or with a detail which made me understand that it is not Italian, were counted as Dialect;
- l) Dialect words pronounced with an attempt of Italianization were counted as Dialect;
- m) All other doubtful cases, which I am not specifying here, were counted as Italian.

## 2.3 Pietro's MLU

In Graph (1) (Cecchin, 2009), we can notice that in Pietro's early productions, the development of the two languages is very balanced, and until 1;10.8 the MLU is almost the same for the two languages.

From 1;11.3 on, the MLU starts growing but the two languages are not equal any more: Italian seems to be the Stronger Language even if the Dialect shows a high MLU and therefore there is not a sharp preference between the two languages.

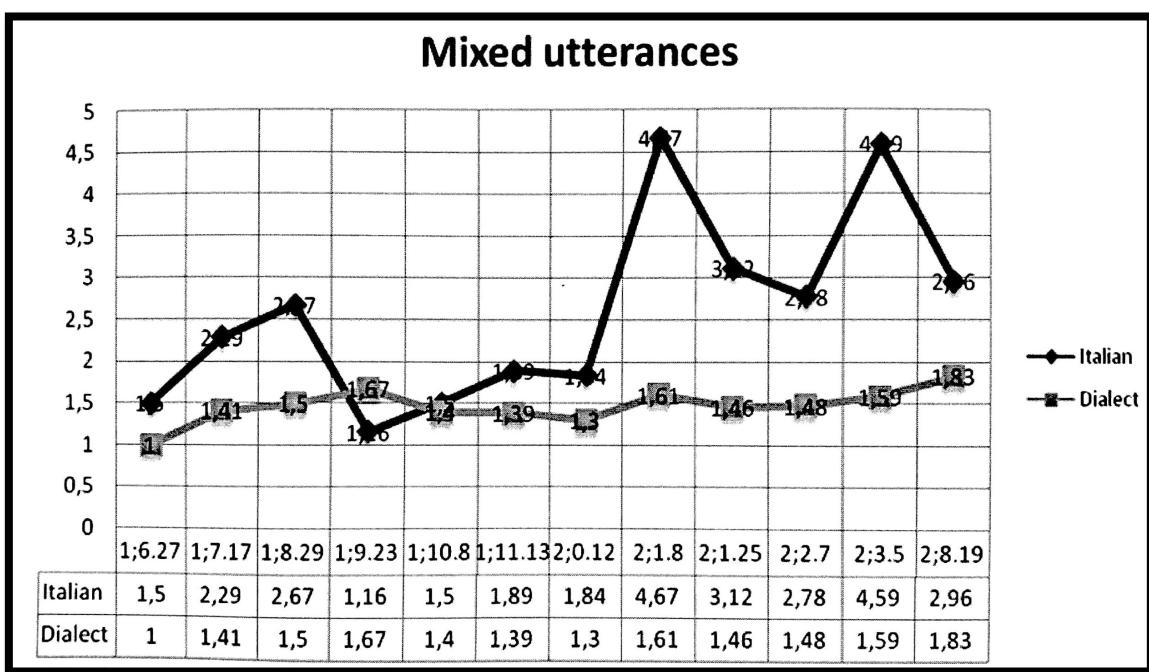

**Graph 1: Pietro's Italian and Dialect utterances**

In Graph (2), the MLUs of mixed utterances are reported, which gives us a wider idea of Pietro's bilingual acquisition (Cecchin, 2009).

In this graph, I calculated two different MLUs: one for Italian (I summed all the Italian words and I divided them by the total of the mixed utterances) and the second one for Dialect (summing all the Dialect words, and dividing them by the number of mixed utterances).

**Graph 2: Pietro's mixed utterances**

It is evident that Italian MLU reaches higher peaks (Cecchin, 2009) than Dialect and from 1;11.13 it remains higher. Dialect MLU is more stable, it only increases as the child grows. As reported in Cecchin (2009), we can notice that the age of 1;10.8 is a crucial point in which Italian and Dialect MLUs intersect each other: in the first graph, the MLU is 1,6 and in graph (2), it is 1,4 for Dialect and 1,5 for Italian. Since then, Italian becomes the Stronger Language, and therefore Dialect is the weaker one.

## 2.4 Marco's MLU

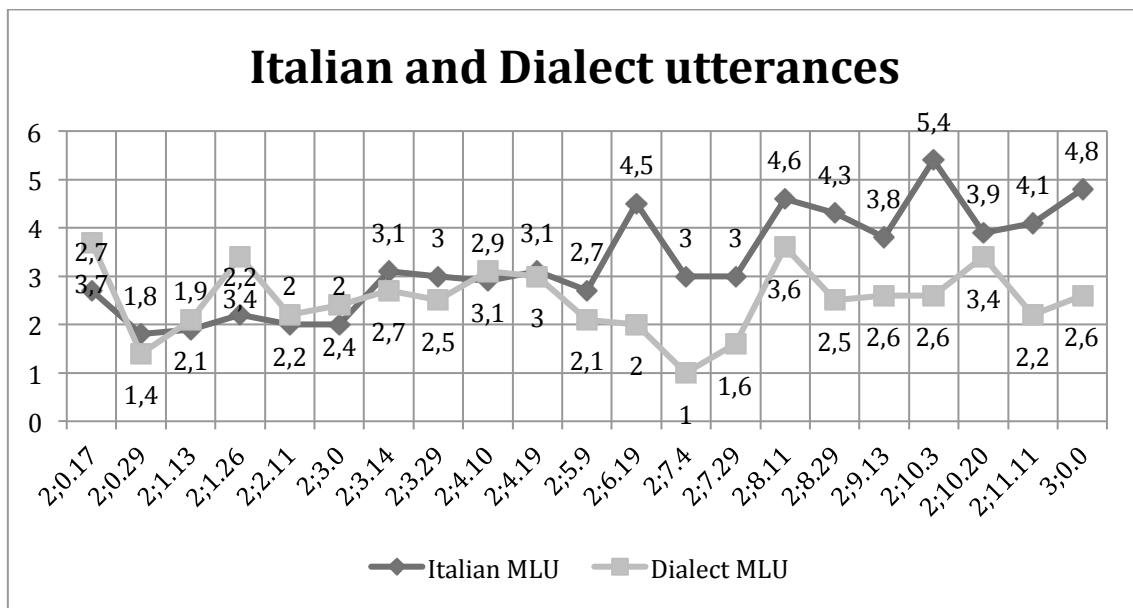

In Graph (3) we can observe Marco's Italian and Dialect MLU. Until 2;3 the dominant language seems to be Dialect, whose MLU values go from 3,7 to 1,4. Italian MLU remains always under 3 (the maximum is 2,7). From 2,3 to 2;4.18, the two languages are approximately the same but Italian starts to be the dominant language. At 2;4.18, Italian and Dialect are almost at the same level (3,1 Italian and 3 Dialect) but from 2;5.9 on, there is a clear separation of the two languages: Italian MLU is much higher than the Dialect MLU. It is interesting to note that the Italian values have augmented a lot compared to the previous ones. Also the Dialect MLU increases at some points, as in 2;8.11 (3,6) and 2;10.20 (3,4), but they never intersect again.

Having a look at graph (3) more in general, we can observe that while Italian is always increasing from the beginning until the last recording, Dialect with its ups and downs always remains approximately at the same level and never reaches 4.

At the beginning of the recordings, the Dialect is the dominant language, then for a short period Italian and Dialect are balanced, and in the end Italian is clearly the Stronger Language.

Another thing to be said is that in all recordings, Marco is effectively bilingual, because he uses both languages, even if the dominance is alternated.

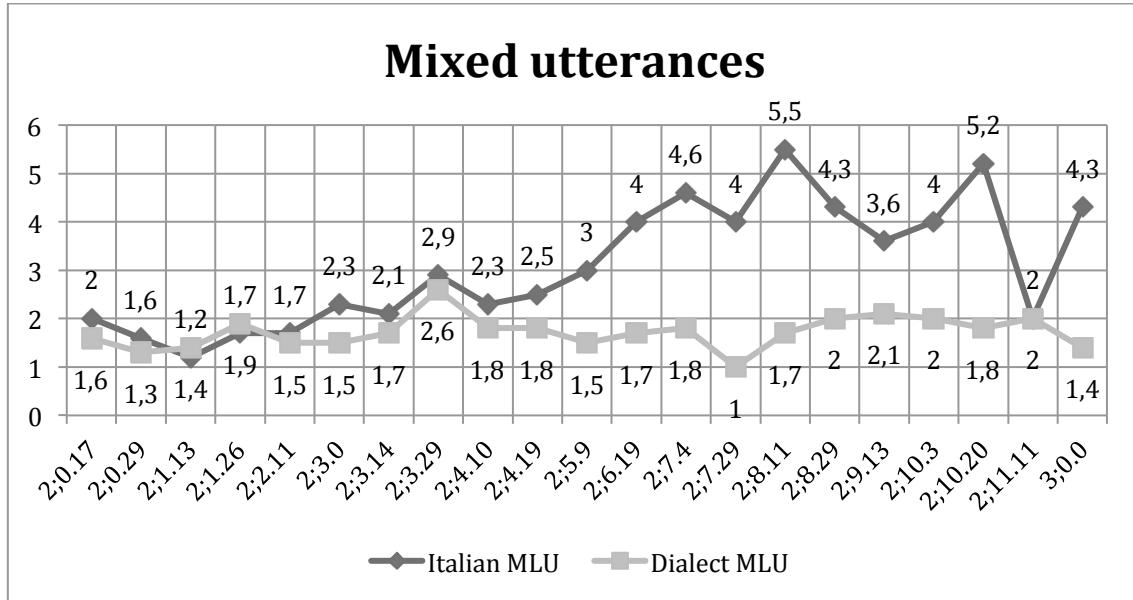

**Graph 3: Marco's Italian and Dialect utterances**

Let's have a look at Marco's mixed utterances in order to have a clearer view of his language development. In graph (4), a more regular trend for the Dialect can be noticed, which remains between MLU 2,6 and 1. Italian is instead quite low at the beginning, but from 2;4.10 on, it quickly increases and reaches high levels like 5,5 and 5,2.

Before 2;3.29, the two languages are balanced and they exchange their dominance: until 2;1.13 the stronger one is Italian, then it is Dialect until 2;2.11 and from that moment on the stronger one is Italian again. The key point in this graph is at 2;3.29 because before both languages are about the same level, and then Italian is strongly higher, it reaches 4,6-5,5 and 5,2; while Dialect stays around 1-2,1. Only at 2;11.11, Italian and Dialect have MLU 2.

**Graph 4: Marco's mixed utterances**

Comparing graphs (3) and (4), we can observe that the trends regarding Italian and Dialect are the same: at the beginning Italian is balanced with Dialect later Italian becomes the Stronger Language and increases its MLU, while Dialect remains quite stable (even though in monolingual Dialect utterances it reaches higher values). In the first half of the recordings, Dialect seems to be dominant, in the second half instead, it is distinctly the Weaker language.

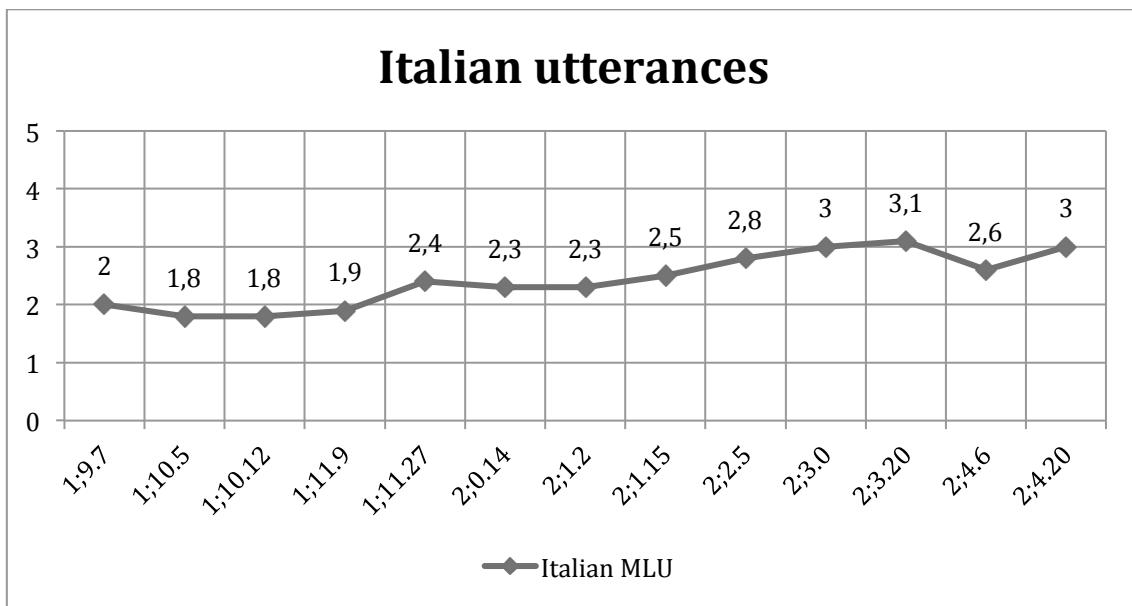

The relevant thing to notice is that in both graph (3) and (4), there is one precise point in which Italian and Dialect MLUs move from having an aligned development to following very different paths. In graph (3) in fact, such point is at 2;4.19, while in graph (4) it is at 2;3.29: almost one month before. I do not have any clear explanation for this difference. Concerning the change of dominant language, I agree with Fabris (2010) who says that probably the child starts to pay more attention to the stimulus around him, which are in most cases in Italian.

## 2.5 Sara's MLU

In this section, we analyze the Italian MLU of a monolingual child who lives in Venice, namely Sara.

In graph (5 a clear increasing trend) can be noticed. At the beginning, the MLU is around 2 (1;8-1;9), and it grows until 3-3.1 toward the last recordings.

**Graph 5: Sara's Italian MLU**

## 2.6 Summing up

For our MLU's analysis, we took 3 children into consideration. Pietro and Marco are bilingual: they both speak Italian and a Venetan Dialect: Pietro the Cittadella's Dialect, whereas Marco the dialectal variety of Rosà. The third child, Sara, is monolingual Italian.

Pietro's recordings start when he is 1;6.27, Sara's ones at the age of 1;9.7, and Marco's ones at 2;0.17. In the last recording, Pietro is 2;8.19, Sara is 2;4.20, and Marco is 3 years old.

Now I will compare Pietro and Sara in the age interval 1;9-2;0 (we do not have any recordings of Marco at this age). We can see that at 1;9.23 and 1;10.8, the two

MLUs of Pietro have the same value, then they start to be more and more different, that is to say that from that moment on, Italian is the dominant language and Dialect is the weaker one. Before that moment, Italian and Dialect have very balanced MLUs, as we said before. Considering just the Italian MLU, we can easily notice that it is very similar to Sara's: Pietro starts with 1,42-1,6-2,02 and 2,07, Sara starts with 2-1,8-1,8-1,9-2,4 and 2,3. But Sara's values are a little bit higher.

I shall now compare the three children at the same age: Pietro (2;0.12-2;3.5), Sara (2;0.14-2;4.20) and Marco (2;0.17-2;4.19). Pietro's Italian MLU increases from 2,07 to 3,31, Sara starts at 2,3 and reaches 3 in the last recording, and Marco begins with 2,7 and reaches 2,9 when he is 2;4.10. In this case as well, we can say that they follow the same path and show very similar values.

In the last recording, Pietro is 2;8.19 and his Italian MLU is 3,3, whereas Marco at 2;8.11 shows a higher MLU:4,6.

I will now focus on the MLUs in Mixed utterances, comparing Pietro (2;0.12-2;3.5) and Marco (2;0.17-2;3.0). Pietro reaches higher peaks in Italian MLU (4,67-4,59), while Marco's MLU is sometimes even lower than the Dialect one. The Dialect MLUs of both children are very similar and have the same trend. At the age of 2;8, the Italian MLU of Marco is very high (5,5-4,3) whereas Pietro's Italian MLU is 2,96. The Dialect MLU is almost the same, instead.

We can conclude that the three children have an equal development of their languages, some differences are noticed but they can be due to personal differences in acquisition.

# **3. Distribution and morphology of the copula in Italian and the Dialects of Cittadella and Rosà**

In this chapter I will describe the morphology and the use of the copula in the Dialects of Cittadella and Rosà.

A copular sentence is composed of the subject, the nominal, adjectival or locative *predicate*, and the verb *to be*, which is called "copula" because it links the subject to the predicate. See the Italian examples in (3), (4) and (5).

- 3) La rosa è un fiore - *The rose is a flower*
  - 4) L'acqua è fresca - *The water is fresh*
  - 5) Il libro è sul tavolo. *The book is on the table*

The copula agrees with the subject, and therefore it can be singular as in (3), (4) and (5), or plural as in (6) and (7).

- 6) Le rane sono anfibi - *Frogs are amphibians*
  - 7) Gli alberi sono verdi - *Trees are green*

In Veneto, each Dialect has its own way to express the verb *to be* (Marcato and Ursini, 1998). In the Venetian variety, for example, people uses *xe* as shown in (8), (9), (10) and (11). In the 3<sup>rd</sup> person, it is underspecified for number, i.e. it is used in both the singular and the plural.

- 8) Me nono xe vecio - *My grandfather is old* (Belloni, 1991:131)

- 9) Me morosa **xe** bionda - *My girlfriend is blond* (Belloni, 1991:131)
- 10) I fiori i **xe** bèi - *The flowers are beautiful*
- 11) Le botiglie e **xe** róte - *The bottles are broken*

Examples (10) and (11) are mine.

Now I will focus my attention on the two Dialects spoken by Pietro and Marco.

### 3.1 The copula in the Dialect of Cittadella

In Cittadella's Dialect, the variety spoken by Pietro, the copula displays different forms in the 3<sup>rd</sup> person.

One form is *zé*. As in Venetian, it has the same form in the 3<sup>rd</sup> person singular and plural. It is the subject clitic pronoun that let us understand if the subject is singular or plural, feminine or masculine, as reported in (12), (13) and (14). The examples are taken from Checchin (2009).

- 12) A *zé* qua co mi (3<sup>rd</sup> sing. fem.)

(3<sup>rd</sup>sg. fem. clitic is here with me)

*She is here with me*

- 13) I *zé* contenti (3<sup>rd</sup> pl. masc.)

(3<sup>rd</sup> pl. masc. clitic are happy)

*They are happy*

- 14) El *zé* dotòre (3<sup>rd</sup> sing. masc.)

(3<sup>rd</sup> sing. masc. clitic is doctor)

*He is doctor*

This dialect displays two other forms in the 3<sup>rd</sup> person singular masculine. In addition to (*el*) *zé*, the 3<sup>rd</sup> person singular masculine can be realized as *l'é/l'è* (with

either a close or an open vowel, Cecchin, 2009). The different forms have the same meaning as shown in (15a) and (15b):

- 15) a. Armando (el) zé el me figliolo

[Armando è il mio figliolo]

(*Armando* (*3<sup>rd</sup>sg. masc. clitic*) *is DET. my little son*)

*Armando is my little son*

- b. Armando l'é el me figliolo, ze vero?

[Armando è il mio figliolo, è vero?]

(*Armando* *3<sup>rd</sup>sg. masc. clitic* *is DET. my little son, is it true?*)

*Armando is my little son, isn't he?*

The verb form *zé* is the only one that can be used in interrogative sentences, as shown in (16).

- 16) a. Cosa zé sucesso ?

*What is happened?*

*What happened?*

- b. \*Cosa (l') é/è sucesso?

*What is happened?*

*What happened?*

Notice that the subject clitic pronoun is realized as either *el* (with *zé*) or *l* (with *é* and *è*) see (17) and (18).

- 17) a. L'è/é rabià

b. El zé rabià

(*3<sup>rd</sup>sg. masc. clitic* *is angry*)

*He is angry*

- 18) a. L'è/é simpatico  
 b. El zé simpatico  
*(3<sup>rd</sup>sg. masc. clitic is nice)*  
*He is nice*

Cecchin (2009) reports that in the past tense, the 3<sup>rd</sup> person singular (feminine) and the 3<sup>rd</sup> person plural (feminine and masculine) of this Dialect can be realized in two ways: *zèra* and with the palatalized consonant *jèra*, as shown in (19), (20) and (21).

- 19) A zèra al supermercato  
 A jèra al supermercato  
*(3<sup>rd</sup> sing. fem. clitic was at-the supermarket)*  
*She was at the supermarket*

- 20) I zèra in posta  
 I jèra in posta  
*(3<sup>rd</sup> pl. masc. clitic were in the post office)*  
*They were at the post office*

- 21) E zèra al pub  
 E jèra al pub  
*(3<sup>rd</sup> pl. fem. clitic were at-the-pub)*  
*They were at the pub*

The 3<sup>rd</sup> person singular masculine has 3 possible realizations (all with an open "è"): *zèra*, *jèra* and *l' èra*. See Cecchin's examples in (22) and (23).

- 22) El zèra al cinema co lu  
 L'èra al cinema co lu  
 El jèra al cinema co lu  
*(3<sup>rd</sup>sg. masc. was at the cinema with him)*

*He was at the cinema with him*

- 23) El zèra in macchina  
L'èra in macchina  
El jèra in macchina  
(3<sup>rd</sup>sg. masc. was in car)  
*He was inside the car*

Cecchin (2009) reports that Pietro only produced the *zé* form, as in (24) and (25).

- 24) (i) zé (r)otti (Pietro 2;12)  
*(3<sup>rd</sup> pl. masc. clitic are broken)*  
*They are broken*

25) (el) zé (s)po(r)co (Pietro 2;1.8)  
*(3<sup>rd</sup> pl. masc. clitic is dirty)*  
*It is dirty*

Despite the fact that in the adult grammar, all these forms are interchangeable and the choice between them depends on the speaker, Cecchin (2009) proposed that Pietro produces the *zé* form because it is the less marked one. First, it can be used both in the singular and the plural third person. Second, it is the only possible form in interrogative sentences. Third, the *zé* form does not need the subject pronoun "el" to be expressed (see (15)). As suggested by Cecchin (2009), Pietro chooses to use this form because he does not have access to the category of subject clitic pronouns, yet.

Cecchin (2009) also hypothesized a generational difference that could influence Pietro's productions. His grandmother, the adult with whom Pietro spends most of the time, accepts the form *l'è/é*, but she never produces it.

## 3.2 The copula in the Dialect of Rosà

The Dialect of Rosà, the variety spoken by Marco, also has two different forms for the verb *to be* in the third person singular masculine. One is pronounced with a close vowel (*zé*), as happens in the 3<sup>rd</sup> person feminine and plural, while the other form is pronounced with an open vowel (*è*), as happens in Italian (Fabris, 2010:69). When the vowel is close, the subject clitic is *el*, whereas when the vowel is open, the subject clitic is pronounced as *l*. See the examples (26), (27), (28) and (29) taken from Fabris (2010).

26) L'è ndà/ndato via.

El zé ndà/ndato via.

(3<sup>rd</sup>sg. masc. clitic gone away)

*He left*

27) A zé ndà/ndata via.

(3<sup>rd</sup>sg. fem. clitic gone away)

*She left*

28) I zé ndà/ndai/ndati via.

(3<sup>rd</sup> pl. masc. clitic gone away)

*They left (masculine)*

29) E zé ndà/ndae/ndate via.

(3<sup>rd</sup> pl. fem. clitic gone away)

*They left (feminine)*

In the past tense, for the singular masculine, there is a third form pronounced with the close vowel "é", that is represented in (30) (Fabris, 2010:72)

30) El zèra/zéra ndà/ndato via.

(3<sup>rd</sup>sg. masc. clitic gone away)

*He left*

Also, for the Dialect of Rosà, the choice between one form or the other, in declarative contexts, is completely free, whereas in interrogative sentences only the zé form is grammatical. See examples (31)

31) a. Dove zéo?

(*Where is 3<sup>rd</sup>sg. masc. clitic*)

*Where is he?*

b. \*Dove l'è?

(*Where 3<sup>rd</sup>sg. masc. clitic is?*)

*Where is he?*

c. \*Dove è lo/o?

(*Where is 3<sup>rd</sup>sg. masc. clitic*)

*Where is he?*

The unique case where both copular forms are acceptable (either in the present or past tense) is in Wh questions introduced by "perché" (=why), as shown in (32) and (33) (Fabris, 2010: 74).

32) Perché l'è inrabià?

(*why 3<sup>rd</sup>sg. masc. clitic is angry?*)

*Why is he angry?*

33) Perché el zé inrabià?

(*why 3<sup>rd</sup>sg. masc. clitic is angry?*)

*Why is he angry?*

Fabris (2010) found that Marco produced the form with close vowel in the majority of cases and only once he produced the form with the open vowel (see

34). Fabris (2010) also found that the Dialectal pronunciation of the copula (with the close vowel) sometimes influenced the Italian pronunciation (which is with the open vowel), as in (35) and (36).

34) Adesso vado dal nono a giustarlo pecché [=perchè] l'è tuto roto  
(Marco 2;3.29)

*(Now go to the grandfather to repair it because 3<sup>rd</sup>sg. masc. clitic is all broken)*

*Now I go to the grandfather to repair it because it's all broken*

35) Dopo té [=c'è] le gal(l)ine (Marco 2;1.26)

*(Then there is the hens)*

*Then there are the hens*

36) Peto é [=è] mio (Marco 2;1.26)

*(this-masc. is mine)*

*This is mine*

# 4. Acquisition of the copula in Italian

This chapter is devoted to the acquisition of the copula in Italian. I will compare the results of previous studies with the monolingual child I studied, namely Sara.

## 4.1 Previous studies

In this section, I will describe some studies that have examined the acquisition of the copula considering several aspects, such as its production and omission, the agreement with the subject of the clause, and the production of the copula in different semantic contexts.

### 4.1.1 Syntax: production and omission of the copula

It is well known that early grammar appears to be slightly different from the adult one. Children tend to quite often omit functional elements such as prepositions, articles, auxiliaries, pronouns and also the copula. The omissions are not random, and several researches (e.g. Rizzi, 1993-1994, 2004, Franchi 2004, 2006) proposed that children follow UG (Universal Grammar) Principles exactly like adults. If children's productions seem to differ from the adult's ones, they are always grammatically based.

Although many studies exist about this topic, the reason for omissions is in many cases still unclear.

Studying the phenomenon of Root Infinitives (RI), Rizzi (1993-1994, 2004) found a pattern in the distribution of the functional verb omission and suggested the *Truncation Hypothesis*.

37) *Mom faire boum sur le camion* (Philippe 2;01 - Child French)

Mom DO bum on the truck

(Example taken from Franchi 2006: 136)

According to this approach children produce sentences like (37) because the parameter which seems to regulate the main projection of the root (the Root Parameter) is not set correctly, and children can choose a node lower than I as the root of their sentence. If they do so, they produce a so-called *Root Infinitive*, a main sentence with an untensed verb. On the contrary, if their structure starts from CP, like adults, they project the full sentence, with all elements in it, tensed verb included.

Rizzi claims that early grammar allows the truncation of the structure, because it reduces children's computational load, but they always do it respecting UG constraints. In other words, if there is an element in the CP field, this should compel a complete clausal structure with inflected forms. Children's productions seemed to confirm this hypothesis because in Wh contexts, RIs almost disappear.

#### **4.1.1.1 Consideration about Franchi's articles (2004, 2006)**

In this section I will present Franchi's researches (2004, 2006), because I used them as a guide for my work.

Franchi (2006) analyzed the omission of functional verbs and compared declarative contexts with Wh-contexts in order to find out if instances of omissions are an indicator of the *Truncation Hypothesis*.

More specifically, Franchi (2004, 2006) took into her analysis three monolingual children speaking Italian, chosen from the CHILDES Database: Martina, Raffaello, and Rosa. They were recorded since they were 1 year and 7 month old (1;7) until 3 years and 3 months (3;3). She collected 1587 copular contexts and organized them as follows, bearing in mind that Italian is a *pro-drop language* and therefore it allows sentences with non-overt subjects (as in (5b)). If we consider the question in (38) (Franchi 2004), in Italian we can answer in three different grammatical ways (39a, b, and c), the fourth one is however ungrammatical (39d).

38) Di che colore è il cappotto?

*What color is the coat?*

- 39)a. Il cappotto è verde. (Overt subject, realized copula, predicate: SCP)  
b. E' verde. (Non-overt subject *pro*, realized copula, predicate: CP)  
c. Verde. (Predicate: P)  
d. \*Il cappotto \_ verde.

The only clear case of copula omission is (39d) because in the adult language, this answer needs the copula to be expressed.

The ambiguous answer is (39c): in a pro-drop language, it can be interpreted either as an elliptical structure or as an instance of copula omission with non-overt subject. In order to take all contexts into adequate consideration, Franchi (2004) separated the contexts with overt subjects from those contexts with non-realized subjects. She considered the omission contexts where the subject is realized and divided them by all contexts that required the copula with overt subjects (40), and to calculate the percentage of omission in contexts with null subjects, she divided all \_P contexts by the number of all non-realized contexts requiring a copula (41). Finally she divided all the omission contexts (*S\_P+pro\_P*) by the total number of copular utterances (42).

$$40) \frac{S\_P \text{ contexts}}{S(C)P \text{ contexts}} \quad 41) \frac{pro\_P \text{ contexts}}{pro(C)P \text{ contexts}} \quad 42) \frac{S\_P+pro\_P \text{ contexts}}{S(C)P+pro(C)P \text{ contexts}}$$

The results obtained using the formula in (40) are "pure" cases of copula omission, because the ambiguous \_P contexts are not included. With those formulas, the presence of \_P contexts is not a problem, and they allow the researcher to calculate values without over-estimating the phenomenon of copula omission.

The strategy that separates children's productions with overt subjects and those with non-realized subjects allows to observe the \_P contexts closer and

check whether they are just elliptical structures or copula omissions, too. This can be deducted if \_P values decrease in a longitudinal analysis, because this means that many copular utterances were in that group.

Franchi (2004) shows in table (2), reported here as table (1), the number of copular contexts she found for each child, and she calculated the percentage of omission of the copula with realized subjects and with non-overt subjects. Note that the number of contexts collected in 2004 is slightly different from the contexts reported in 2006 (see table (2)) I think there is a typo (underlined by a circle) in table (2). The problem is that here Franchi never specifies if the contexts are only declarative, or both interrogative and declarative.

**Table 1: copular contexts in Franchi (2004)**

**Tabella 2:** Numero di occorrenze e percentuale di omissione della copula in contesti con soggetto espresso (SP/SCP) e con soggetto nullo (P/CP).

	Contesti SP/SCP	% SP/SCP	Contesti P/CP	% P/CP
<b>Martina</b> 1;7 – 2;7	69/197	35%	70/169	41%
<b>Raffaello</b> 1;7 – 2;11	30/113	27%	92/218	42%
<b>Rosa</b> 1;7 – 3;3	136/382	36%	310/506	61%
<b>TOTALE</b>	235/692	<b>34%</b>	472/893	<b>53%</b>

**Table 2: copular contexts in Franchi (2006)**

**Table 1.** Number of omissions in Realised Subject contexts (SP/S(C)P), in Null Subject contexts (P/(C)P) per child and in total

	SP/S(C)P	P/(C)P	n. total
Martina 1;7–2;7	68/200	71/167	139/367
Raffaello 1;7–2;11	30/113	92/218	122/331
Rosa 1;7–3;3	136/382	310/507	446/889
Total	234/895	473/892	707/1587

**Table 2.** Omission rate in Realised Subject contexts (SP/S(C)P), in Null Subject contexts (P/(C)P) per child and in total

	% SP/S(C)P	% P/(C)P	% total
Martina 1;7–2;7	34%	43%	38%
Raffaello 1;7–2;11	27%	42%	37%
Rosa 1;7–3;3	36%	61%	50%
Total	34%	53%	45%

Later in the articles, Franchi focuses on the omission in interrogative sentences and she refers to the data presented before (table (1) and (2)) as data "found in declarative copula contexts" (2006: 143). Therefore I will compare my data to Franchi's only when they are about declarative contexts.

Moreover, when Franchi (2004, 2006) shows the omission percentage found in interrogative contexts, she does not distinguish between overt and non-overt subjects and it is impossible to infer the total amount of contexts she analyzed.

My analysis will be more detailed, first I will consider all the copular contexts I found (declaratives and interrogatives), then I will separate them and observe how the omission percentage changes. For the reasons I previously explained, I can not always compare my data to Franchi's. Nevertheless it must be added that since in Franchi (2004, 2006), the omission percentage in Wh contexts is very low (0,4%), it will not change the omission percentage of the declarative sentences.

## 4.1.2 Morphosyntax: agreement between the copula and its subject

Another study on the use and the omission of the copula in Italian has been conducted by Caprin and Guasti (2006, 2008), who wanted to find out if children behave differently with the verb "be" when it is a copula or an auxiliary.

They based their research on the spontaneous productions by fifty-nine children aged 22 to 35 months. They divided those children into three groups, not established on their ages but on their MLU-w (MLU calculated in words) values: G1 (N=15) 1.0-1.49; G2 (N=19) 1.5-1.99; G3 (N=25) 2.0-3.1.

The results are reported in table (3).

**Table 3: Caprin and Guasti (2006)**

GROUP	COPULA					
	I <sup>a</sup> p.sg	II <sup>a</sup> p.sg	III <sup>a</sup> p.sg	I <sup>a</sup> p.pl	II <sup>a</sup> p.pl	III <sup>a</sup> p.pl
G1	N.C.	N.C.	100	N.C.	N.C.	100
	0/0	0/0	49/49	0/0	0/0	1/1
G2	N.C.	N.C.	96.8	N.C.	N.C.	100
	0/0	0/0	181/187	0/0	0/0	10/10
G3	100	100	97.65	N.C.	N.C.	96.72
	2/2	2/2	374/383	0/0	0/0	59/61
Total	100	100	97.58	N.C.	N.C.	97.22
	2/2	2/2	604/619	0/0	0/0	70/72

The table shows the cases of correct agreement between the subject and the copula: for each inflectional form, the correct use in percentage and the number of correct forms over the total number of forms produced are reported (Caprin and Guasti 2006: 122). The 3rd person singular is the most produced form in general and is already used in G1. As the MLU-w values increase, the copula production also raises. The 3rd person plural is the second most produced form especially in G3, but also in G2.

As reported in the study, agreement errors between the copula and its subject occur very rarely, and when it happens, a substitution of the 3rd person plural with the singular form is produced.

### 4.1.3 Semantics: different types of copula sentences

I will now describe a study that has been conducted by Becker (2000, 2004). Becker studied the productions by 5 children speaking American English ranging in age from 2,0 to 3,4. Their MLU was between 2,2 and 4,7, as reported in table (4).

**Table 4: Becker (2000)**

child (source)	file range	age range	MLU range (avg.)	no. <i>be</i> contexts
Nina (Suppes 1973)	07-13	2;0-2;2	2.79-3.43 (2.98)	471
Peter (Bloom 1970)	06-11	2;0-2;3	2.26-3.33 (2.84)	785
Naomi (Sachs 1983)	35-68 <sup>3</sup>	2;0-2;7	2.61-3.66 (3.09)	555
Adam (Brown 1973)	10-28 <sup>4</sup>	2;7-3;4	2.23-4.12 (3.38)	792
Eve (Brown 1973)	15-20	2;1-2;3	3.7-4.57 (4.03)	566

She did not include into her analysis those contexts that were made of a single PP, or AP, or NP (I call them \_P contexts), because they could be elliptical structures and not "pure" copula omissions.

She divided the contexts into two different categories: the first one was formed with Nominal Predicates (NP) and the second one with Locative Predicates (PP).

The following examples are taken from Becker (2004):

#### *Nominal predicates*

- 43) Patsy's a girl (Peter, 2;3, from Bloom, 1970)
- 44) She's a crocodile (Naomi, 2;3, from Sachs, 1983)

#### *Locative Predicates*

- 45) I in the kitchen (Nina, 2;1, from Suppes, 1974)
- 46) He way up dere [=there] (Adam 3;0, from Brown, 1973)

Becker noticed that the copula was generally realized in the NP contexts and omitted in the Locative ones, as shown in table (5).

**Table 5**

Mean Proportion of Overt Be With Nominal and Locative Predicates				
Child	Nominal Predicate		Locative Predicate	
	M	N	M	N
Nina	74.1	143	13.0	115
Peter	86.4	398	18.9	90
Naomi	90.2	122	33.3	30
Adam	52.0	302	7.7	26
M	76.3		18.8	

Becker explains the strong difference between the two categories in the following way. The omission of the copula is linked to the semantic feature of the predicate: Nominal predicates express a permanent property, as in *Mommy is a girl* (she called it *Stage Level Predicates*), whereas locative predicates indicate a more temporary property of the subject, as in *my pen down there* (called *Individual Level Predicates*).

Becker also studied copula omission in existential expressions and found out that the children pronounced the copula in 80% of the cases. Some examples of the constructions they produced are listed in (47).

- 47) a.\*NIN: there's a light.  
 b.\*NAO: there some for Mommy. (Naomi 2;0)  
 c.\*PET: there's a wheel. (Peter 10)  
 d.\*ADA: dere [there] some boots. (Adam 10)  
 e. \*EVE: there'sanotherhat. (Eve 17)

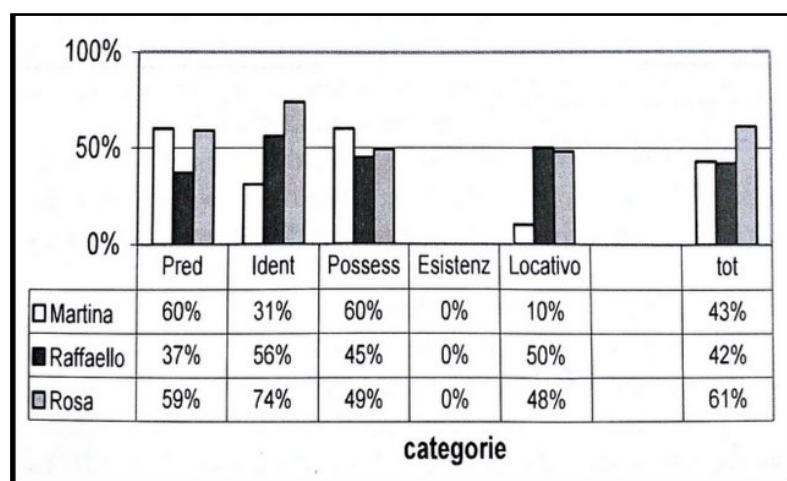

#### 4.1.3.1 Becker's theory applied to Italian

Franchi (2004: 97) checked if Becker's observations were also valid for Italian. She created 5 different categories in order to classify the predicate:

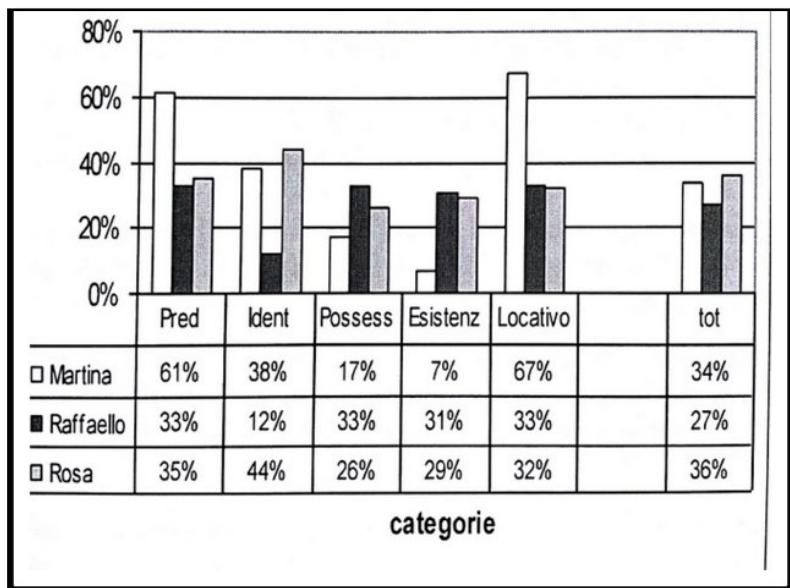

- *Predicative*: an Adjectival Phrase (*La neve è fredda*-The snow is cold) or a Prepositional Phrase (*Questo è di ghiaccio* - This is made of ice);
- *Identificative*: a Determiner Phrase, in either order (*Questo è il gatto*- this is the cat), (*Il gatto è questo* - This one is the cat)
- *Possessive*: realized as either an adjective (*Questo è tuo*- This is yours) or a prepositional phrase (*La giacca è del papà*- This is dad's jacket)
- *Existential*: involves structures like *c'è la torta* -there is the cake"
- *Locative*: realized as either a locative adverb (*qui-here*) or a locative Prepositional Phrase (*a casa-at home*)

Franchi's results are reported in graphs (6) for the contexts with non-realized subject and (7) for the constructions that contain an overt subject.

**Graph 6: Franchi's results with non-overt subjects (%\_P/CP)**

**Graph 7: Franchi's results with realized subjects (S\_P/SCP)**

The results found by Franchi (2004) do not seem to support the hypothesis made by Becker (2000, 2004), because omission is not influenced by the kind of predicate. Each child omits the copula in unpredictable ways.

## 4.2 Sara

I will now present the copular sentences I have collected from the recording of a monolingual Italian-speaking child called Sara (Ambrosi, 2007). She was 1;9.7 at her first recording and 2;4.20 at her last one, therefore her corpus reports her development for 7 months.

### 4.2.1 Syntax: production and omission of the copula by Sara

I collected all the copular sentences she produced: 294. For the analysis, I followed the categorization proposed by Franchi (2004) and I obtained two types of copula realization (as in (48) and (49)) and two contexts of copula omission (as in (50) and (51)):

SCP: the subject is realized and the copula is produced

48) Questo è rosa.

(Sara; 2;1.15)

(*This is pink*)

*This one is pink*

CP: the subject is not realized (*pro*) but the copula is pronounced

49) E' uguale. (Sara; 2;4.6)

(*pro is identical*)

*It is identical*

S\_P: the subject is overt and the copula is not realized

50) Questo (è) uguale. (Sara; 2;4.6)

*This (is) identical*

\_P: the subject is non-overt and the copula is not pronounced

51) La mamma (Sara; 1;11.27)

(*the mother*)

*This is my mother*

Table (6) shows the copular contexts I found, distributed into each category.

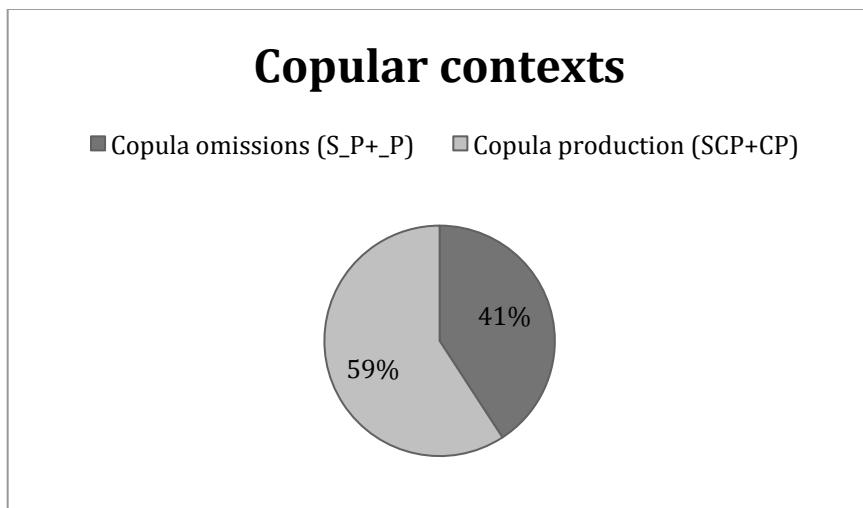

**Table 6: Sara's copular contexts**

	COPULA OMISSION		COPULA PRODUCTION	
	S_P contexts	_P contexts	SCP contexts	_CP contexts
<b>1;9.7</b>	1	16	0	4
<b>1;10.5</b>	1	12	0	2
<b>1;10.12</b>	0	16	1	3
<b>1;11.9</b>	2	14	2	3
<b>1;11.27</b>	0	7	3	3
<b>2;0.14</b>	0	12	16	7
<b>2;1.2</b>	0	6	5	3
<b>2;1.15</b>	0	3	5	13

<b>2;2.5</b>	0	4	27	7
<b>2;3.0</b>	0	6	7	11
<b>2;3.20</b>	0	8	9	9
<b>2;4.6</b>	3	6	3	12
<b>2;4.20</b>	0	3	13	6
<b>TOT.</b>	<b>7</b>	<b>113</b>	<b>91</b>	<b>83</b>
<b>TOT.</b>	<b>120</b>		<b>174</b>	
<b>TOT.</b>	<b>294</b>			

Graph (8) gives us a more general view of how copula's omissions and productions are distributed in the whole number of copular contexts I collected.

**Graph 8: Sara's copula contexts**

Looking at graph (8), it is clear that Sara produces the copula in the majority of cases: 174 out of the total number of contexts (59%). And when she uses the copula, she produces it correctly with no morphological or structural mistakes, as shown in (52), (53), (54) and (55). She uses the copula both in the 3<sup>rd</sup> person singular (52), (54) and plural (53), and in the 2<sup>nd</sup> singular form (55).

52) E' questo.

(Sara 2;1.12)

*It's this one.*

53) Dove sono?

(Sara 2;1.12)

*Where are they?*

54) E' giallo il sole.

(Sara 2;2.5)

*It's yellow the sun*

55) Eri tutta nera e tutta bianca.

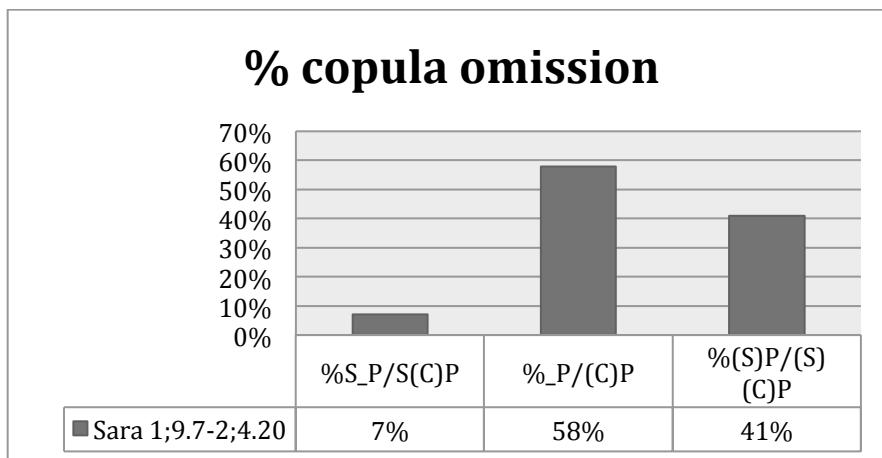

(Sara 2;3.20)

*You were all black and all white*

Now we will focus on the omissions of the copula in Sara's corpus and we will analyze them from a longitudinal perspective in order to understand her development.

In graph (9) and in table (7), I considered three different categories: omissions in contexts with realized subjects (S\_P/S(C)P), omissions with non-realized subjects (\_P/(C)P); the last one is the total number of omissions.

**Graph 9: percentage of copula omission**

**Table 7: number and percentage of copula omission**

	Contexts S_P/S(C)P	% S_P/S(C)P	Contexts _P/(C)P	% _P/(C)P	Contexts (S)_P/(S)(C)P	% (S)_P/(S)(C)P
<b>Sara</b> 1;9.7- 2;4.20	7/98	7%	113/196	58%	120/294	41%

It clearly appears that copular structures are available in Sara's grammar, and that the copula can sometimes be omitted.

It is interesting to observe that she very rarely (7/98) omits the copula in contexts where the subject is expressed. She instead produces many omissions in \_P contexts (113/196).

In order to make a correct comparison with Franchi (2004), it must be observed that Sara produced fewer S(C)P contexts than the children studied in Franchi (2004), reported in table (8). Nevertheless, Sara's omission in S\_P contexts is really low.

**Table 8: children studied by Franchi (2004)**

	SP/S(C)P	P/(C)P	n. total
Martina 1;7-2;7	68/200	71/167	139/367
Raffaello 1;7-2;11	30/113	92/218	122/331
Rosa 1;7-3;3	136/382	310/507	446/889
Total	234/895	473/892	707/1587

Now I consider Sara's development about copula omission more in detail in table (9) and in graph (10), which is a graphical representation of the data in table (9), and shows for each recording the number and percentage of copula omission in all the three categories

**Table 9: copula omission in number and in percentage for each recording**

	S_P/S(C)P	_P/(C)P	(S)_P/(S)(C)P
<b>1;9.7</b>	1/1	100%	16/20
<b>1;10.5</b>	1/1	100%	12/14

**Graph 10: percentage of copula omission for each recording**

The omission of the copula is present in Sara: it is more evident in early recordings and then gradually decreases.

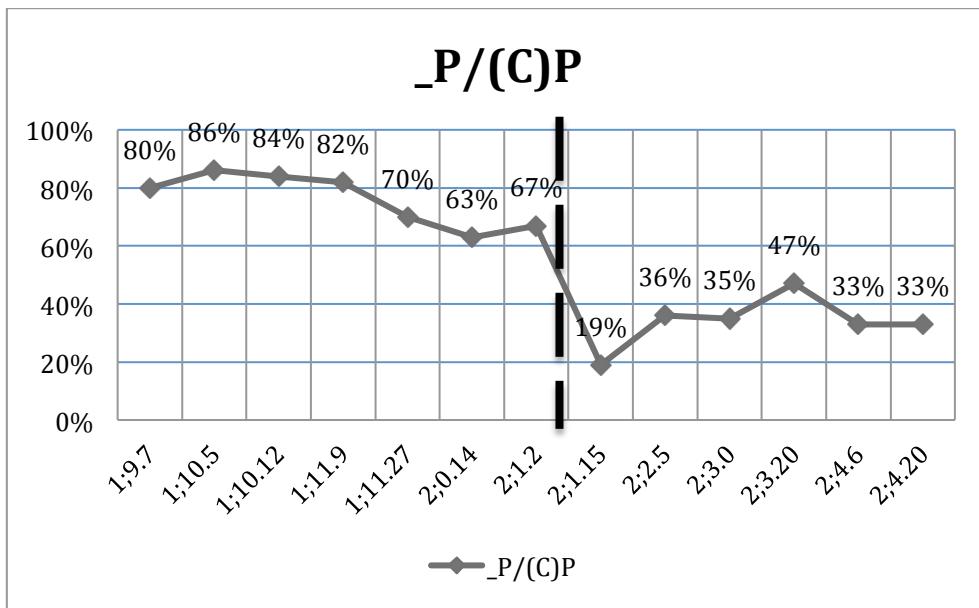

Franchi (2004) finds an interesting peculiarity analyzing children's productions: she noticed that there is a moment between two recordings where the omission of the copula is suddenly strongly less present than in the recording before. She divided the recordings in two periods: the *first stage*, in which the percentage of copula omission is higher, and a *second stage* where the omission value is lower. Considering the three children that she studied, she found that in the first stage the percentage of omission was always higher than 50%, on the contrary in the second stage it was under 30% Raffaello and Martina, and under 45% Rosa. The cut between the *two stages* was between 1;11.20 and 2;1.12 for Martina, between 2;4.29 and 2;5.13 for Raffaello, and between 2;5.25 and 2;6.29 for Rosa.

Observing graph (10), we can say that *two stages* can be also identified in Sara. See graphs 11, 12, 13. A vertical line divides the *first* from the *second stage*.

In graph (11), a sudden change emerges between the recordings before 2;1.2 and after 2;1.15. In the first recordings, the percentage of omissions never goes

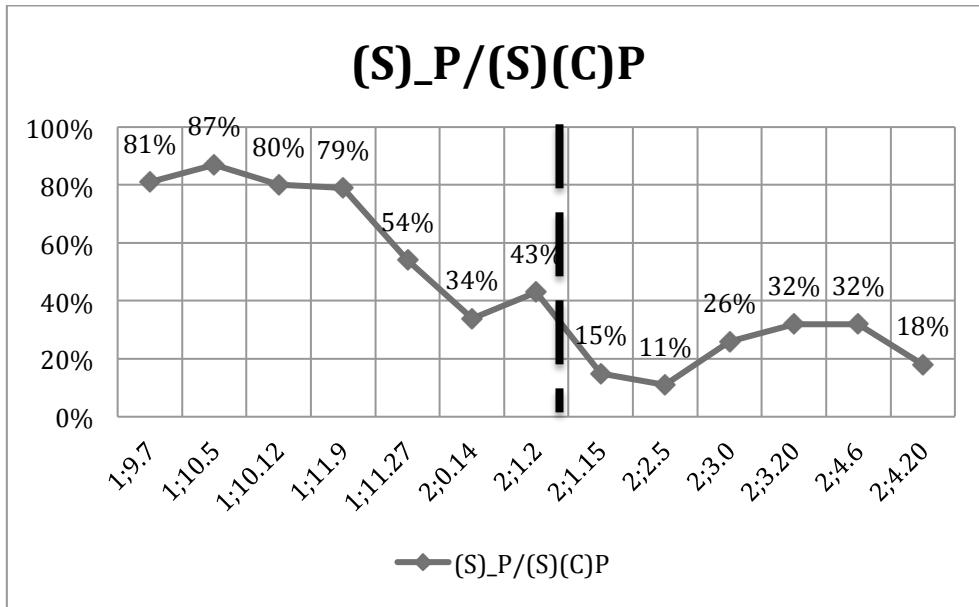

under 63%, whereas in the second stage it never reaches values higher than 47%. Therefore I draw the line that indicates the two stages between 2;1.2 and 2;1.15. The mean of omissions in the two phases is very different: 77% in the *first stage* and 36% in the *second*.

**Graph 11: copula omission in utterances with non-realized subjects and the *two stages***

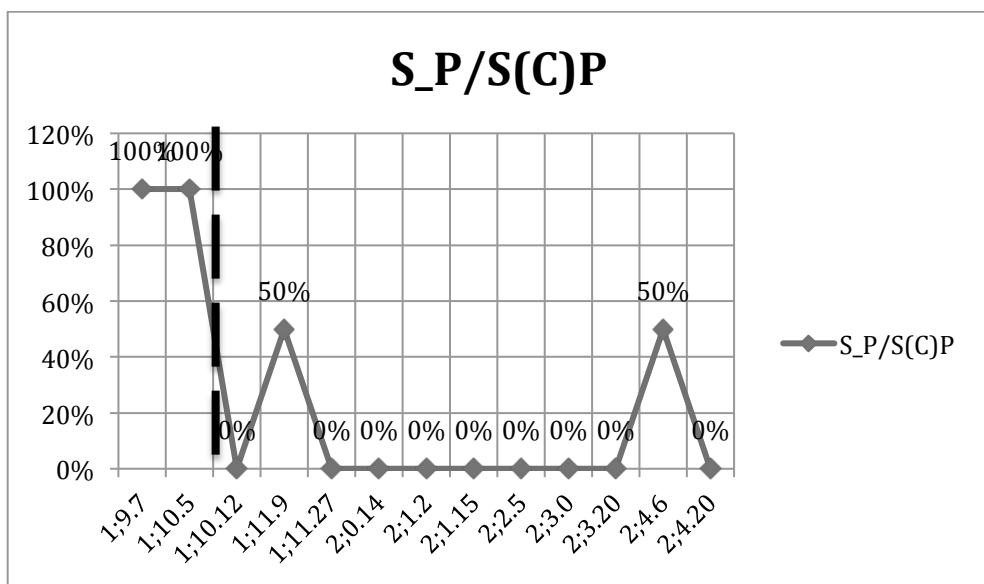

The total amount of omissions shows a trend similar to the one found in contexts with non-realized subjects: also in this case, the cut between the *first* and the *second stage* lies between 2;1.2 and 2;1.15. Before that point the percentage value swings from 87% to 34%, after that point it never goes under 11% and never goes higher than 32%. The mean of copula omissions is very different: 65% in the *first stage* and 22% in the *second*.

**Graph 12: total percentage of copula omission and the two stages**

In graph (13) I finally analyzed the contexts with overt subjects (S\_P). The data clearly show that the cut between the *two stages* is much earlier, between the recordings at 1;10.5 and 1;10.12:

**Graph 13: contexts with overt subjects and the cut point between the two stages**

Franchi (2004) analyzed the two groups of utterances *\_P* and *S\_P* separately and found two *stages* and a clear cut between them in both cases. Sara does not follow the same pattern: first of all, she only produced 7 *S\_P* utterances in all recordings. This is a very low number compared to the amount of copula utterances with overt subjects produced by the children studied by Franchi (2004). And those 7 *S\_P* contexts create a very strange trend when they are analyzed in percentage, because in the first two recordings (1;9.7 and 1;10.5) Sara only produces *S\_P* sentences, thus the result is 100%. Later, at 1;11.9, she only produces 2 *S\_P* contexts but also 2 SCP sentences (see table 8) and therefore the percentage changes into 50%; at 2;4.6 she realizes the copula in 3 out of 6 contexts with an overt subject. Despite the changing in percentage values, she always produces very few *S\_P* sentences at a time, and it is therefore difficult to draw the line that divides the *two stages*. If I apply the parameters used by Franchi (2004), I identify the cut between the *two stages* between 1;10.5 and 1;10.12, because before that moment the percentage is both times 100% and later it drastically decreases and it is never higher than 50%. Following this reasoning, there is a big difference between this *cut* and the one that I found in contexts with non-overt subjects, because, as we have seen before, the cut in *\_P* constructions is between 2;1.2 and 2;1.15 (see graph 11).

Remember that the *\_P* category of sentences is not "pure" because, as said in section 4.1, it also contains elliptical structures.

Therefore, I suggest that the real cut between the *two stages* is the one found in sentences with overt subjects, as shown in graph (13). From that moment on, Sara produces full copular structures with both overt subjects and overt copula. She keeps producing *\_P* contexts but graph (11) shows that one month later than the new *cut point* (1;10.5-1;10.12) they start decreasing, too.

So my hypothesis is that Sara's cut between the *first* and the *second stage* is very early compared to the data in Franchi (2004), reported in table (10). This fact matches with her low copula omission values in contexts with overt subjects (*S\_P*). She seems to be very competent about the use of the copula and closer to the adult grammar than the children studied by Franchi (2004). This proficiency could be due to different causes that not necessarily exclude each other, such as a quicker

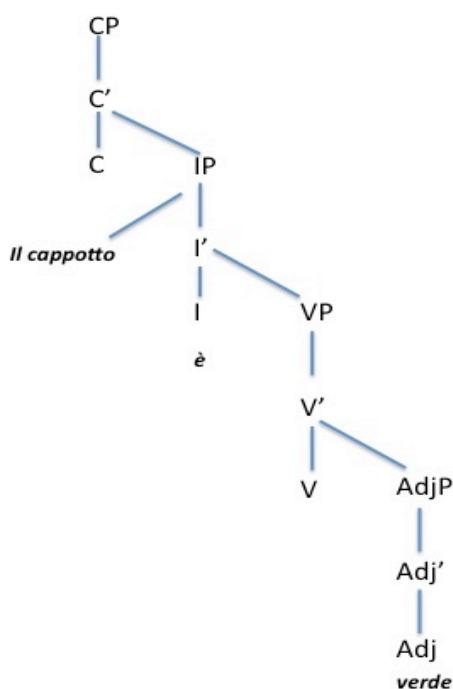

development in acquisition and in setting the *Root Parameter*, a strong amount of stimuli from her well educated familiar environment, and the fact that she spends most of her time among adult people. Her poor production of overt subjects may be due to age: her last recording is at 2;4.20, while Franchi's children are recorded until 2;7 Martina, 2;11 Raffaello and 3;3 Rosa.

**Table 10: cut points found by Franchi (2004)**

	Age
Martina	1;11.20
	2;1.12
Raffaello	2;4.29
	2;5.13
Rosa	2;5.25
	2;6.29

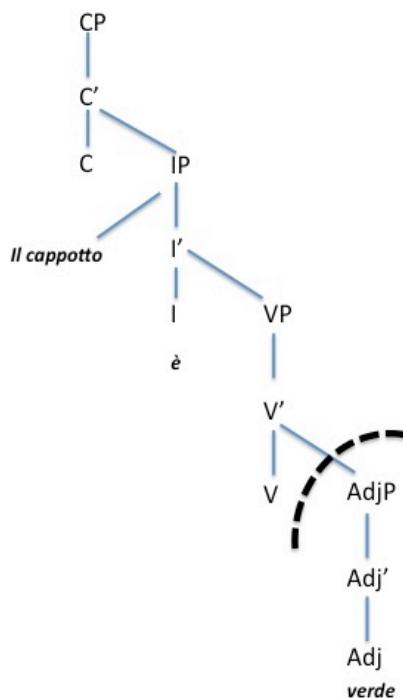

Another fact to take into consideration is that Sara omits the copula only in 7 contexts out of 98 with overt subjects, whereas she omits the copula 113 times out of the total amount of contexts with non-overt subjects, that is 196 (table 9). My hypothesis is in terms of the Truncation hypothesis: as with Wh-questions (see section 4.3.2 below), the presence of the subject implies the construction of a more complete sentential structure, which requires the copula. As shown in (56), the node that hosts the subject (Spec IP) is higher than the copula located in I, and this hierarchy seems to force the realization of the copula. In other words, the presence of the subject correctly realized before the copula imposes the creation of a full-structure sentence (CP included), with the verb and the predicate.

56)

In those cases where the subject is not realized and only the predicate is pronounced (\_P), the omission of the copula is possible because the structure may be truncated just above AdjP and create an elliptical sentence, as shown in (57)

57)

The structure could not be truncated above VP, as Rizzi (1993/1994) pointed out. If that was the case, structures with untensed verbs, so called root infinitives, should be possible in Italian, contrary to fact. I can therefore suppose that if the copula is not produced at all, truncation is located above AdjP.

The result of this process is that the computational load for the child is lower and the structure is easier.

This hypothesis is a confirmation of Rizzi's theory and could be a plausible explanation for the data I found: the omission of the copula in contexts with the subject is less found than in those situations where the subject is not pronounced. This happens because Sara has not set the Root Parameter yet and therefore it is possible for her to use lower nodes as root of the sentence.

#### **4.2.2 How repetition affects Sara's productions**

In Franchi (2004), we find that the only cause that could distort the values when considering the \_P category of copula omission are elliptical structures, as I have said in 4.1.1. I believe that there is another phenomenon that could mislead the analysis, which is *repetition*.

The repetition of words or sentences is a very important task used in researches about early language acquisition (Costa and Friedmann, 2012, Lust, Flynn and Foley, 1996). This task is very important because many researchers start from the idea that a child could never repeat a sequence of words if he or she has not developed the linguistic competence and the cognitive structure to support it. Therefore, it can be assumed that when a child repeats something, he does not merely repeat it, he reconstructs it. "Speakers of a language cannot repeat a sentence in their native language as a simple auditory string" (Costa and Friedmann, 2012: 364).

According to Bloom, Hood and Lightbown (1974), a child imitates a new linguistic structure only when he or she has acquired the full cognitive competence necessary for that structure. Their examples, reported in (58) and (59), show that children do not simply imitate a sentence but they reconstruct it:

58) *Adult* The red beads ( $\emptyset$ ) and brown beads are here.

*Child* Brown beads here an' a red beads here. (2;3;3)

59) *Adult* The owl eats candy and ( $\emptyset$ ) runs fast.

*Child* Owl eat candy...owl eat the candy and he run fast. (2;4;3)

Repetition is a very important task in order to better understand the child's grammatical competence and his or her capacity to reconstruct the grammatical structure of what he or she has just heard.

Looking at Sara's, the difference between copula omissions in \_P contexts (113 cases) and copula omissions in S\_P constructions (7 cases) is surprising. Looking at the former cases more closely, I made the hypothesis that not all the contexts I counted are actual omissions, but maybe they are just repetitions.

The question is if Sara imitates copular contexts and if repetition could explain why she produces so many \_P contexts compared to S\_P ones.

I analyzed Sara's corpus again, and in table (11) I have reported how many repetitions I have found among the copular contexts I have previously listed. In table (12), the *free* pronounced contexts are counted.

**Table 11: cases of repetition in Sara's corpus**

	COPULA OMISSION		COPULA PRODUCTION	
	S_P contexts	_P contexts	SCP contexts	_CP contexts
1;9.7	0	0	0	0
1;10.5	0	2	0	0
1;10.12	0	3	0	0
1;11.9	0	3	0	0
1;11.27	0	1	0	0
2;0.14	0	3	1	0
2;1.2	0	3	1	1

<b>2;1.15</b>	0	0	0	0
<b>2;2.5</b>	0	0	0	<b>1</b>
<b>2;3.0</b>	0	0	0	0
<b>2;3.20</b>	0	<b>1</b>	0	0
<b>2;4.6</b>	0	<b>2</b>	0	0
<b>2;4.20</b>	0	0	0	0
<b>TOT.</b>	<b>0</b>	<b>18</b>	<b>2</b>	<b>2</b>

**Table 12: Contexts of free production**

	COPULA OMISSION		COPULA PRODUCTION	
	S_P contexts	_P contexts	SCP contexts	_CP contexts
<b>1;9.7</b>	1	16	0	4
<b>1;10.5</b>	1	10	0	2
<b>1;10.12</b>	0	13	1	3
<b>1;11.9</b>	2	11	2	3
<b>1;11.27</b>	0	6	3	3
<b>2;0.14</b>	0	9	15	7
<b>2;1.2</b>	0	3	4	2
<b>2;1.15</b>	0	3	5	13
<b>2;2.5</b>	0	4	27	6
<b>2;3.0</b>	0	6	7	11
<b>2;3.20</b>	0	7	9	9
<b>2;4.6</b>	3	4	3	12
<b>2;4.20</b>	0	3	13	6
<b>TOT.</b>	<b>7</b>	<b>95</b>	<b>89</b>	<b>81</b>

The above tables show that Sara produces very few cases of repetition: 18 in \_P contexts, 2 in SCP and \_CP. It is interesting that she never repeated a copular

sentence with overt subject by omitting the copula. In other words, no S\_P sequence is found in repetition.

Although repetitions imply that the child knows the repeated structure, I calculated the rate of omissions again without counting repetitions in table 12b.

**Table 12b: rate of omissions without repetitions**

	S_P/S(C)P		_P/(C)P		(S)_P/(S)(C)P	
<b>1;9.7</b>	1/1	100%	16/20	80%	17/21	81%
<b>1;10.5</b>	1/1	100%	<b>10/12</b>	<b>83%</b>	<b>11/13</b>	<b>85%</b>
<b>1;10.12</b>	0/1	0%	<b>13/16</b>	<b>81%</b>	<b>13/17</b>	<b>76%</b>
<b>1;11.9</b>	2/4	50%	<b>11/14</b>	<b>79%</b>	<b>13/18</b>	<b>72%</b>
<b>1;11.27</b>	0/3	0%	<b>6/9</b>	<b>67%</b>	<b>6/12</b>	<b>50%</b>
<b>2;0.14</b>	<b>0/15</b>	0%	<b>9/16</b>	<b>56%</b>	<b>9/31</b>	<b>29%</b>
<b>2;1.2</b>	<b>0/4</b>	0%	<b>3/5</b>	<b>60%</b>	<b>3/9</b>	<b>33%</b>
<b>2;1.15</b>	0/5	0%	3/16	19%	3/21	14%
<b>2;2.5</b>	0/27	0%	<b>4/10</b>	<b>40%</b>	<b>4/37</b>	<b>11%</b>
<b>2;3.0</b>	0/7	0%	6/17	35%	6/24	25%
<b>2;3.20</b>	0/9	0%	<b>7/16</b>	<b>44%</b>	<b>7/25</b>	<b>28%</b>
<b>2;4.6</b>	3/6	50%	<b>4/16</b>	<b>25%</b>	<b>7/22</b>	<b>32%</b>
<b>2;4.20</b>	0/13	0%	3/9	33%	3/22	14%
TOT.	<b>7/89</b>	<b>8%</b>	<b>95/176</b>	<b>54%</b>	<b>102/272</b>	<b>37.5%</b>

The high difference between S\_P (only 7 cases) and \_P constructions (95 cases) remains. In other words, the substantial difference between \_P and S\_P contexts can be seen in both repetition (table 11) and free production contexts (table 12): in both cases, omissions in constructions with no subjects are much more consistent.

Considering the other two categories: SCP and CP, there is no big difference because Sara produces the copula in the same number of contexts (table 12).

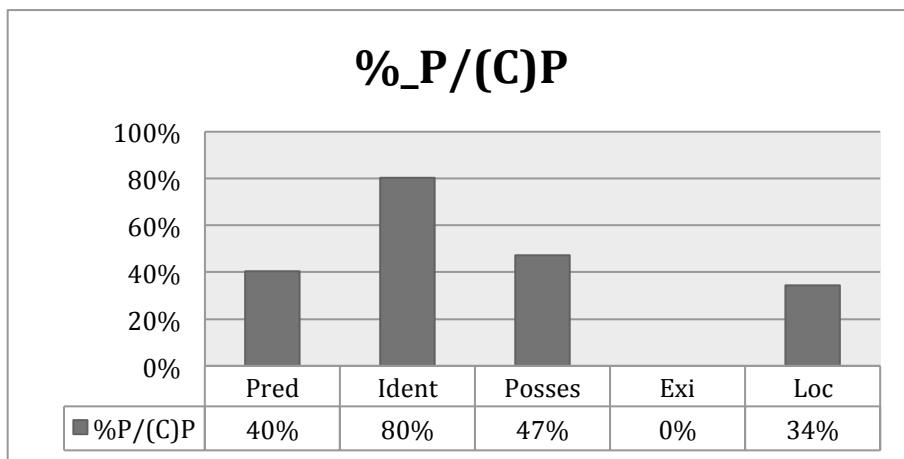

In general, it can be said that Sara tends to repeat phrases instead of sentences: the cases of repetition in \_P are much more than SCP or \_CP. This

suggests that Sara chooses to pronounce the copula in those contexts and she does not simply repeat them.

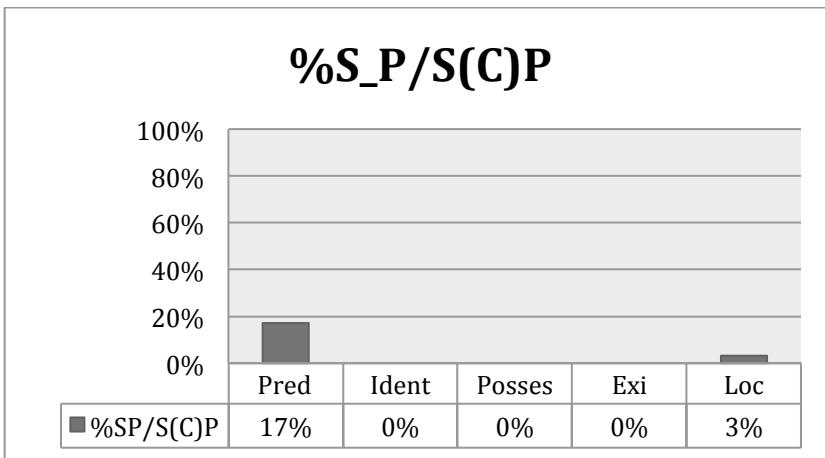

#### **4.2.3 Effects of grammatical or semantic class of the predicate on copula omission**

In order to check whether Sara produces the copula more often in some semantic categories than in others, I followed Franchi's classification described in 4.1.3.1 (see graphs (11), (12) and (13)). Graph (14) shows Sara's copular omissions in contexts with non-realized subjects ( $\_P/(C)P$ ), whereas (15) concerns the contexts where the subject is realized ( $S\_P/S(C)P$ ) .

**Graph 14: percentage of copula omission with non-overt subjects ( $\_P/(C)P$ )**

**Graph 15: percentage of copula omission with overt subjects (S\_P/S(C)P)**

**Table 13: number and percentage of copula omission in each category**

	_P/(C)P		S_P/S(C)P	
<b>Predicative</b>	21/52	40%	5/29	17%
<b>Identificative</b>	73/91	80%	0/23	0%
<b>Possessive</b>	9/19	47%	0/7	0%
<b>Existential</b>	0/5	0%	0/11	0%
<b>Locative</b>	10/29	34%	1/32	3%

Results in table (13) show that Becker's hypothesis is not confirmed: Sara omits the copula much more frequently in nominative predicates than in locative ones. These results replicate Franchi's results.

The examples below show Sara's omissions in each category.

*Predicative*

60) (è) dispettoso (Sara 2;4.6)

*(he is) naughty*

61) Quello (è) giallo (Sara 2;4.6)

*That one (is) yellow*

*Identificative*

- 62) (è) la farfalla (Sara 2;3.0)  
*(It is) the butterfly*

*Possessive*

- 63) (è) mio (Sara 2;3.20)  
*(it is) mine*

*Locative*

- 64) (è) den(r)o (Sara 1;9.7)  
*(it is) inside*

- 65) du [=dov'è] la fettuta [=forchetta]? (Sara 1;11.9)  
*Where (is) the fork?*

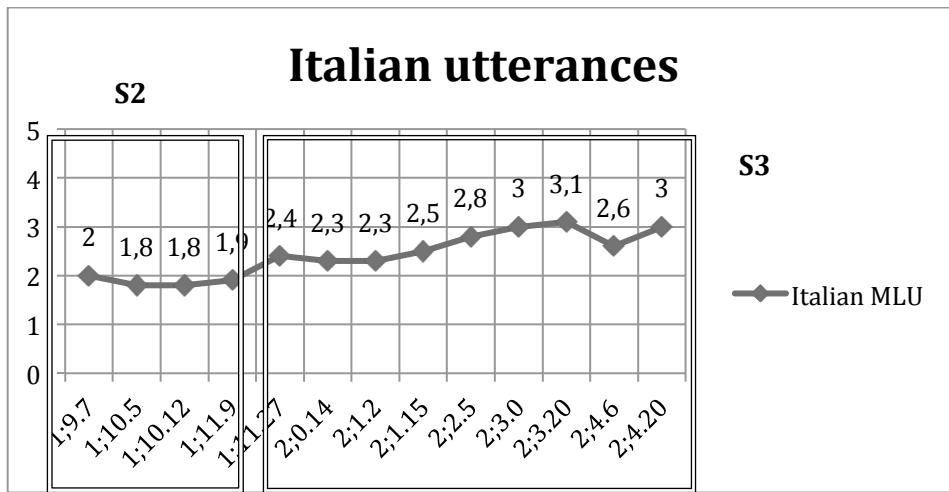

It is interesting to notice that Sara never omits the copula in existential contexts, whereas Franchi's children do it.

#### **4.2.4 Focusing on agreement**

In section 4.1, I briefly described Caprin and Guasti's analysis (2006) of agreement errors between the copula and its subject. They created 3 groups according to the MLU-w of the children. I've followed the same procedure with Sara: I analyzed if there are agreement errors in her productions in each MLU stage identified in Caprin and Guasti (2006).

Note that the lowest MLU value that Sara shows in her recordings is 1.8, and therefore we can not compare her results with the first group identified by Caprin and Guasti ( $S1=1.0-1.49$ ). As we can see in the graph showing Sara's MLU (section 2.5, graph 5), the first four recordings can be gathered together and compared to Caprin and Guasti's second group ( $S2=1.5-1.99$ ), and the remaining 9 recordings have a MLU similar to their third group ( $S3= 2-3.1$ ). The result of this classification is reported in graph (16).

**Graph 16: Sara's MLU divided into Caprin and Guasti's stages**

In table (14), the sentences where the copula is realized are counted.

**Table 14: number of correct/wrong forms in Sara's corpus**

	Correct forms	Wrong forms	Total structures
Sara S1	15	/	15
Sara S2	149	9	158
<b>TOT</b>	<b>164</b>	<b>9</b>	<b>173</b>

We can notice that in "Sara S1", she produces the copula in very few cases, only 15. When she does it, the copula is always correct. In Sara's corpus included in S1, there are only 2 cases in which she uses the 3<sup>rd</sup> person plural copular form; in those two cases, the copula is correct and used in declarative utterances.

Concerning "Sara S2", it is clear that she produces many more sentences with the realized copula; she makes only 9 mistakes. Those errors all have the same property: she uses the 3rd person singular instead of the 3rd person plural. And she does that in 4 declarative sentences and in 5 Wh- questions. Considering the total amount of copular contexts analyzed in "Sara S2" (158), we only find 10 cases with a plural subject and only 1 of them is correctly produced.

Summing up, Sara produces a lower amount of sentences with realized copula compared to those analyzed by Caprin and Guasti (2006). If we consider "Sara S1", we can observe that she follows the same percentage of correct agreement as in Caprin and Guasti (2006), that is 100%. In "Sara S2", the percentage is different because she produces correctly only 10% of plural copulas, compared to 96% in Caprin and Guasti (2006: 122).

#### 4.2.5 Wh contexts and copula omission

The percentage of copula omission changes if we analyze declarative contexts and Wh contexts separately (Franchi 2004).

In order to check if Sara respects this trend, I isolated all the interrogative contexts. There are 34 interrogative copular sentences. Table (15) reports the number and percentage of copula omission and productions in wh-questions:

**Table 15: copula omissions and productions in Wh contexts**

	Contexts	Omissions	Productions	% Omission
<b>1;9.7</b>	1	1	0	100%
<b>1;10.5</b>	0	0	0	-
<b>1;10.12</b>	0	0	0	-
<b>1;11.9</b>	2	1	1	50%
<b>1;11.27</b>	0	0	0	-
<b>2;0.14</b>	14	0	14	0%
<b>2;1.2</b>	0	0	0	-
<b>2;1.15</b>	4	0	4	0%
<b>2;2.5</b>	7	0	7	0%
<b>2;3.0</b>	0	0	0	-
<b>2;3.20</b>	1	0	1	0%
<b>2;4.6</b>	1	0	1	0%
<b>2;4.20</b>	4	0	4	0%
<b>TOT.</b>	<b>34</b>	<b>2</b>	<b>32</b>	<b>6%</b>

Graph (17) shows the percentage of omissions in Wh contexts and in declarative sentences.

**Graph 17**

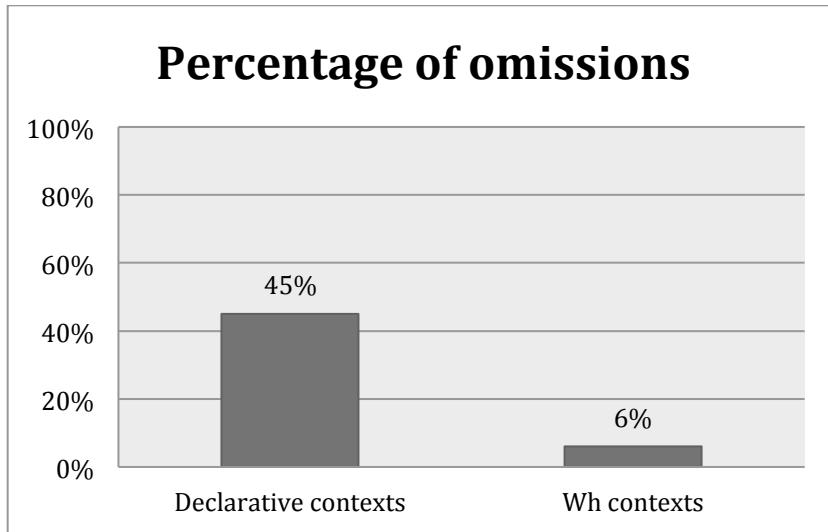

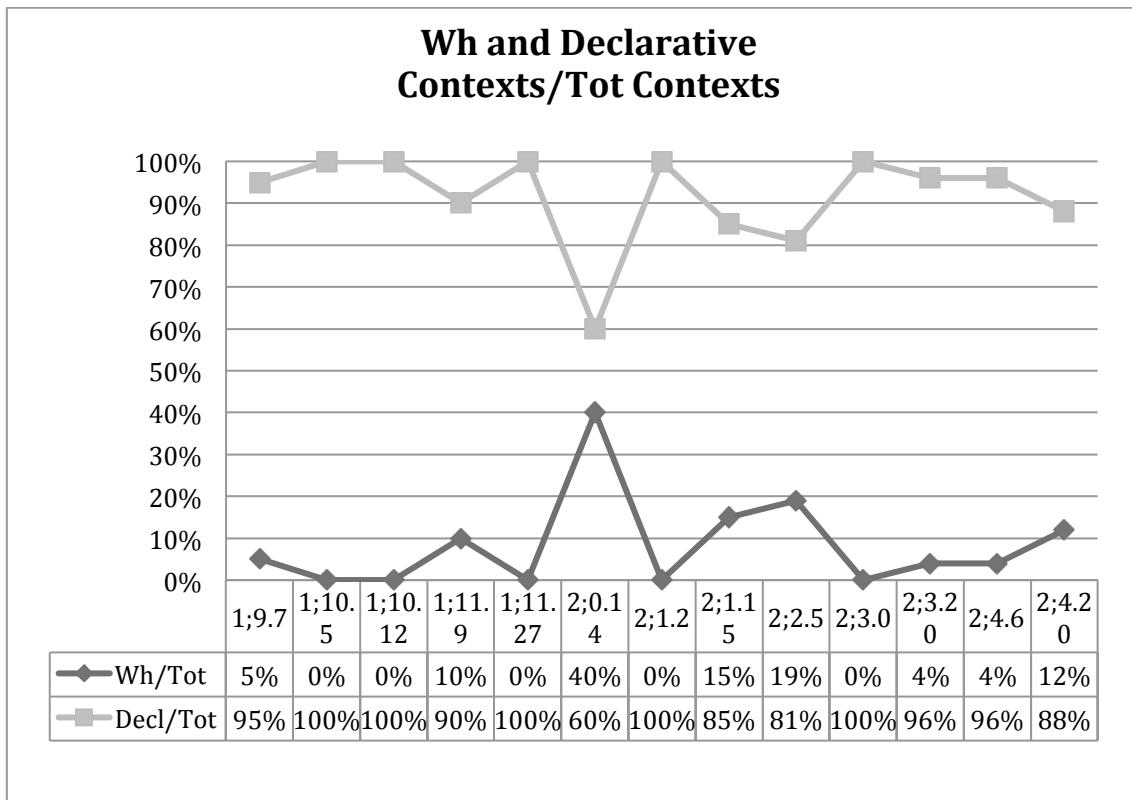

Table (15) and graph (17) clearly show that in Sara, the omission of the copula in Wh contexts is not allowed, in fact she produces only 2 cases with omission of the copula, in earliest productions.

From a longitudinal perspective, it is clear that at the beginning, Sara omits the copula. As Franchi (2004) points out, omissions in declarative contexts happen simultaneously to copula production in Wh constructions. Therefore it can be assumed that the copula is obligatory in Wh contexts, whereas in declaratives it is not so.

The cut line between the *two stages* in wh-questions is located between 1;11.9 and 1;11.27, that is one month after the cut I have found in graph (13) concerning sentences with realized subjects.

In table (15) and in graph (18), it appears that there is not a gradual growth of Wh contexts, on the contrary, very few of them are produced.

**Graph 18: percentage of declarative contexts and Wh contexts in relation to the total amount of copular contexts for each recording**

The table below (16) shows the percentage of copula omission in declarative contexts. I have also reported table (9), repeated here as (16b), to compare the percentages of all contexts together more easily (Declaratives + Wh)

**Table 16: percentage of copula omission in Declarative contexts**

	S_P/S(C)P		_P/(C)P		(S)_P/(S)(C)P

<b>2;1.2</b>	<b>0/5</b>	<b>0%</b>	<b>6/9</b>	<b>67%</b>	<b>6/14</b>	<b>43%</b>
<b>2;1.15</b>	<b>0/5</b>	<b>0%</b>	<b>3/16</b>	<b>19%</b>	<b>3/21</b>	<b>14%</b>
<b>2;2.5</b>	<b>0/27</b>	<b>0%</b>	<b>4/11</b>	<b>36%</b>	<b>4/38</b>	<b>11%</b>
<b>2;3.0</b>	<b>0/7</b>	<b>0%</b>	<b>6/17</b>	<b>35%</b>	<b>6/24</b>	<b>25%</b>
<b>2;3.20</b>	<b>0/9</b>	<b>0%</b>	<b>8/17</b>	<b>47%</b>	<b>8/26</b>	<b>31%</b>
<b>2;4.6</b>	<b>3/6</b>	<b>50%</b>	<b>6/18</b>	<b>33%</b>	<b>9/24</b>	<b>38%</b>
<b>2;4.20</b>	<b>0/13</b>	<b>0%</b>	<b>3/9</b>	<b>33%</b>	<b>3/22</b>	<b>14%</b>
<b>TOT.</b>	<b>7/98</b>	<b>7%</b>	<b>113/196</b>	<b>58%</b>	<b>120/294</b>	<b>41%</b>

Between table (16) and (16b) there is no big difference in the omission percentage. That is due to the low number of interrogative contexts. Sara's

omission in contexts with realized subjects is only 7%, as I said before this seems to indicate that her structure is full and complete. On the contrary she produces more omissions in \_P contexts, where the structure is elliptical and truncated (see 57). The omission values in contexts without the subject in (16) are similar to Franchi's (2004), whereas when the subject is realized, Franchi's children omit the copula more often than Sara (see table 1 and 2).

#### 4.2.6 Articles

I will now briefly describe the production of articles in those contexts where they are normally used in the adult grammar, regarding all the copular contexts I have found in Sara's corpus. I collected 127 contexts in which the determiner should be realized but I added also those contexts in which Sara produces the article before proper names (like *la Carlotta*), because in the Venetan variety of Italian the article is generally pronounced in this context.

Not all the categories are present in table (17) because in some of them, the article was never necessary (as in S\_P, for example).

Some examples of Sara's use of the article are reported in (66), (67), (68) and (69).

##### *Article omission*

- 66) Foie [=foglie] (Sara, 1;10.12)

*Leaves*

*The leaves*

- 67) Du è [=dov'è] rinocironti [=rinoceronti]? (Sara, 2;0.14)

*Where is rhinoceroses?*

*Where are the rhinoceroses?*

##### *Article production*

- 68) Du è [=dov'è] la Veronica? (Sara, 2;1.2)

*Where is Veronica?*

- 69) La strega (Sara, 2;2.5)  
*The witch*

**Table 17: percentage of articles' use**

_P	84%
SCP	95%
_CP	80%
Wh SCP	96%
Wh S_P	100%
<b>Tot.</b>	<b>89%</b>

Table (17) shows that Sara realizes articles properly in 89% of the cases. She has a full competence of this grammatical property.

### 4.3 Summing up

In this chapter, I compared the results from previous studies on the acquisition of the copula in Italian (Franchi 2004, 2006; Caprin and Guasti 2006, 2009) with the productions of Sara, the monolingual Italian child I analyzed.

Sara produces more copulas than sentences with copula omission. In the last recordings, the percentage of copula omission decreases but the interesting thing that differentiates Sara from Franchi's children is that she produces a very small amount of S\_P contexts, only 7%. This is very important to remark because the S\_P contexts are the "pure" ones, namely those where copula omission is basically different from adults. She produces a remarkable number of omissions in contexts with non-overt subjects compared to those with realized subjects. I propose that she does so because there is a difference in structure between the two constructions. In particular, the sentences with overt subjects are more similar to Wh- questions (which have a complete structure with no truncation), because the copula is almost never omitted.

Moreover, Sara's trend seems to suggest a different position for the cut line between the *two stages* suggested by Franchi: in \_P contexts, the turning point is between 2;1.2 and 2;1.15, and in S\_P contexts between 1;10.5 and 1;10.12.

Sara's results were analyzed in order to see if she imitates the adults around her when she produces the copular sentences. The imitation cases are however very few. She chooses to produce many more \_P contexts compared to the S\_P ones.

I then investigated Sara's production applying the categories created in Franchi (2004) in order to see if Becker's theory is also valid for Italian. Sara produces more omissions in nominative predicates compared to locative ones. Becker's hypothesis is not confirmed by my data.

I also took into consideration the results in Caprin and Guasti (2006) concerning morphological agreement. Sara only makes 8 mistakes in the production of the copula: in all those cases, she uses the third person singular instead of the plural one. Considering the third person plural, Sara only produces one correct form.

I then analyzed Wh- contexts. Sara confirms Franchi's results because she produces the copula in the vast majority of cases, even if that kind of contexts are very few, just 34 out of 294 copular sentences (e.g., 12 %).

The last section of this chapter concerned the production of articles in copular contexts. Sara shows a full competence of articles because she pronounces them in the vast majority of cases.

# **5. Acquisition of the copula in bilingual children**

In this chapter, I will analyze the productions of two bilingual children, Pietro and Marco, who speak Italian and one Venetan Dialect: Pietro speaks the Dialect of Cittadella and Marco the Dialect of Rosà.

As I did in Chapter 4 with the Italian-speaking child Sara, I will compare the data from these two children to the previous studies that I have briefly described in section 4.1: Franchi (2004-2006), Caprin and Guasti (2006-2009), and Becker (2000, 2004).

## **5.1 Pietro**

The data I am considering about Pietro have been collected by Cecchin (2009). He was 1;6.27 at his first recording and 2;3.5 at the penultimate. There is a 5 months gap between this and the last recording, at the age 2;8.19.

In Cecchin (2009), Pietro's analysis has been done considering Italian and Dialect together. Here, I decided to keep the two languages separate in order to have a clearer view of how Italian and Dialect develop.

I collected 735 copular sentences, 652 are produced in Italian and 83 are Dialectal. I have also found 14 mixed copular contexts, this means that they have been produced with both languages in one and the same sentence.

I divided copular utterances as Franchi did (paragraph 4.1.1), in 4 different contexts:

SCP: the subject is realized and the copula is produced

70) Questo è un aereo

(Pietro 2;8.19)

(*This is a plane*)

*This is a plane*

CP: the subject is not realized (*pro*) but the copula is pronounced

71) E' morbido. (Pietro; 2;2.7)

(*pro is soft*)

*It is soft*

S\_P: the subject is overt and the copula is not realized

72) Que(s)te (sono) (cia)batte (Pietro; 2;1.8)

*These (are) slippers*

\_P: the subject is non-overt and the copula is not pronounced

73) (sono) (zuc)chine (Pietro; 1;8.29)

(*are*) *zucchini*

(*those are*) *zucchini*

As I said for Sara (4.2), I will use the formula reported here:

$$74) \frac{S\_P \text{ contexts}}{S(C)P \text{ contexts}}$$

$$75) \frac{pro\_P \text{ contexts}}{pro(C)P \text{ contexts}}$$

$$76) \frac{S\_P+pro\_P \text{ contexts}}{S(C)P+pro(C)P \text{ contexts}}$$

In this way I kept separate the contexts with overt from those with non-overt subjects.

In table (18) for Italian and in table (19) for Dialect, I have reported all the copular sentences I found with omissions and productions.

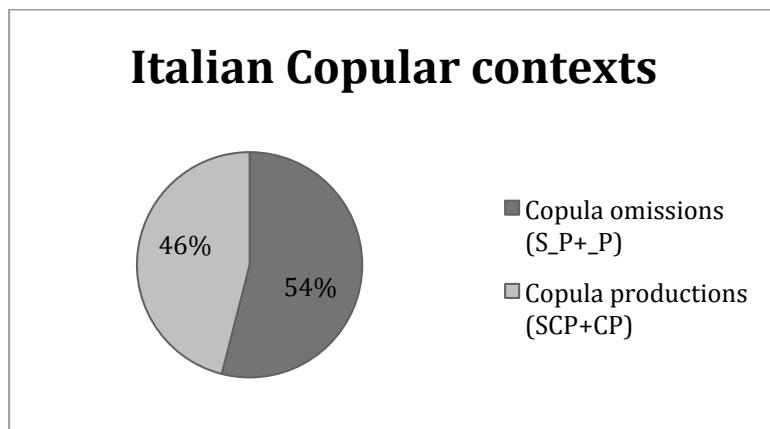

**Table 18: Pietro's copular contexts in Italian**

	COPULA OMISSION		COPULA PRODUCTION	
	S_P contexts	_P contexts	SCP contexts	CP contexts
<b>1;6.27</b>	0	26	0	1
<b>1;7.17</b>	2	46	1	2
<b>1;8.29</b>	1	32	1	2
<b>1;9.23</b>	0	35	1	4
<b>1;10.8</b>	15	35	8	7
<b>1;11.13</b>	0	7	2	4
<b>2;0.12</b>	0	18	0	4
<b>2;1.8</b>	7	27	10	33
<b>2;1.25</b>	9	24	4	27
<b>2;2.7</b>	0	16	10	28
<b>2;3.5</b>	1	13	68	30
<b>2;8.19</b>	5	33	9	44
<b>Tot.</b>	<b>40</b>	<b>312</b>	<b>114</b>	<b>186</b>
<b>Tot.</b>	<b>352</b>		<b>300</b>	
<b>Tot.</b>	<b>652</b>			

In Italian, Pietro produces 652 copular contexts. 352 are contexts in which he omits the copula and in 300 cases he produces it. He produces only 40 S\_P compared to the 312 of the \_P category, whereas the number of SCP and CP contexts is not so different (114 and 186).

Graph (19) shows the percentage of omissions and productions for Italian.

**Graph 19: Pietro's Italian copular contexts**

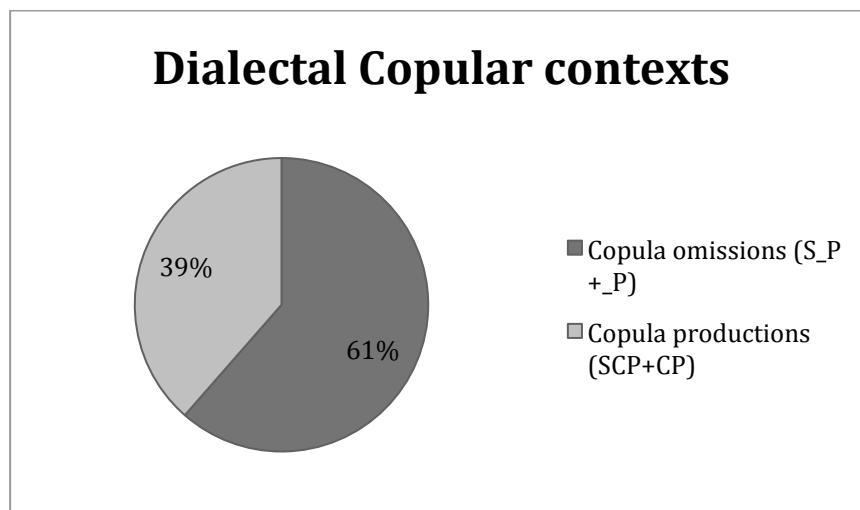

**Table 19: Pietro's copular contexts in Dialect**

	COPULA OMISSION		COPULA PRODUCTION	
	S_P contexts	_P contexts	SCP contexts	CP contexts
<b>1;6.27</b>	0	4	0	0
<b>1;7.17</b>	1	20	0	1
<b>1;8.29</b>	0	2	0	0
<b>1;9.23</b>	0	4	0	0
<b>1;10.8</b>	0	7	0	1
<b>1;11.13</b>	0	1	0	0
<b>2;0.12</b>	0	0	0	1
<b>2;1.8</b>	0	7	0	5
<b>2;1.25</b>	0	1	0	4
<b>2;2.7</b>	0	0	0	0
<b>2;3.5</b>	0	0	2	0
<b>2;8.19</b>	0	4	4	14
<b>Tot.</b>	<b>1</b>	<b>50</b>	<b>6</b>	<b>26</b>
<b>Tot.</b>	<b>51</b>		<b>32</b>	
<b>Tot.</b>	<b>83</b>			

Speaking of Dialect, the total number of context I have collected is 83: 51 of them are omissions and 32 are contexts where the copula is pronounced. Also in this case, I found a big difference between the S\_P contexts (just 1) and the \_P contexts (50). He produced very few full constructions with the subject and the predicate realized (SCP 6), while in the CP category there are 26 productions.

Graph (20) shows the percentage of omissions and productions in Dialect.

**Graph 20: Pietro's Dialectal copular contexts**

The graphs show that Pietro omits the copula in the majority of cases both in Italian and in Dialect, but with a higher percentage (61%) for the Dialect, even though the Dialectal productions are only 83 in comparison with the Italian ones (652). When he realizes the copula, he does it correctly with no morphological or structural mistakes, as we can see in (77), (78) for Italian, and (79),(80) for Dialect.

- 77) E' qua (Pietro; 2;012)  
*it is here*

- 78) E' mia que(s)ta (Pietro; 2;2.7)  
*This is mine*

79) (i) ze rotti  
*(they) are broken*

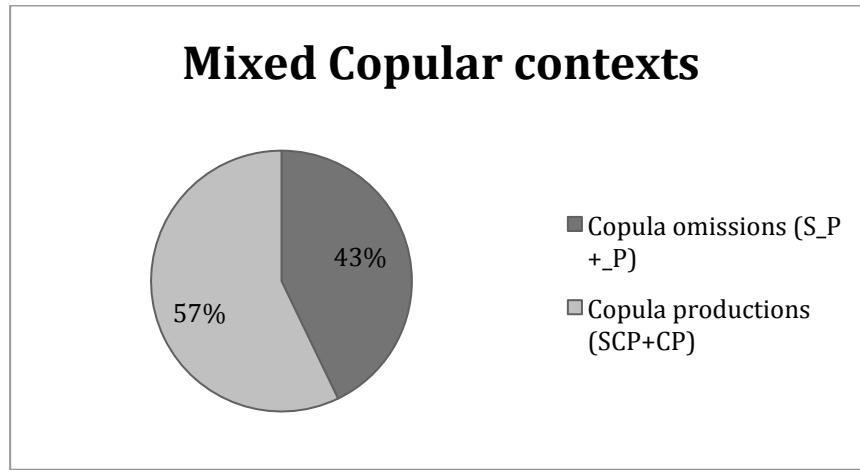

80) Questi i ze tuti bei  
*These are all beautiful*

In table (20), I show the mixed copula contexts I found, and in graph (21) I have represented the percentage of omission and production of the copula.

**Table 20: Pietro's copular contexts in mixed utterances**

	COPULA OMISSION		COPULA PRODUCTION	
	S_P contexts	_P contexts	SCP contexts	CP contexts
<b>1;6.27</b>	0	0	0	0
<b>1;7.17</b>	1	1	0	0
<b>1;8.29</b>	0	0	0	0
<b>1;9.23</b>	1	3	0	0
<b>1;10.8</b>	0	0	0	0
<b>1;11.13</b>	0	0	1	1
<b>2;0.12</b>	0	0	0	0
<b>2;1.8</b>	0	0	2	1
<b>2;1.25</b>	0	0	0	2
<b>2;2.7</b>	0	0	0	0
<b>2;3.5</b>	0	0	0	0
<b>2;8.19</b>	0	0	0	1
<b>Tot.</b>	<b>2</b>	<b>4</b>	<b>3</b>	<b>5</b>
<b>Tot.</b>	<b>6</b>		<b>8</b>	
<b>Tot.</b>	<b>14</b>			

**Graph 21: Percentage of Pietro's mixed copular contexts**

In mixed copular contexts, Pietro produces the copula slightly more often (8 cases) compared to the times he omits it (6 times). Also in this case when he produces it, he does it correctly, like in (81) and (82).

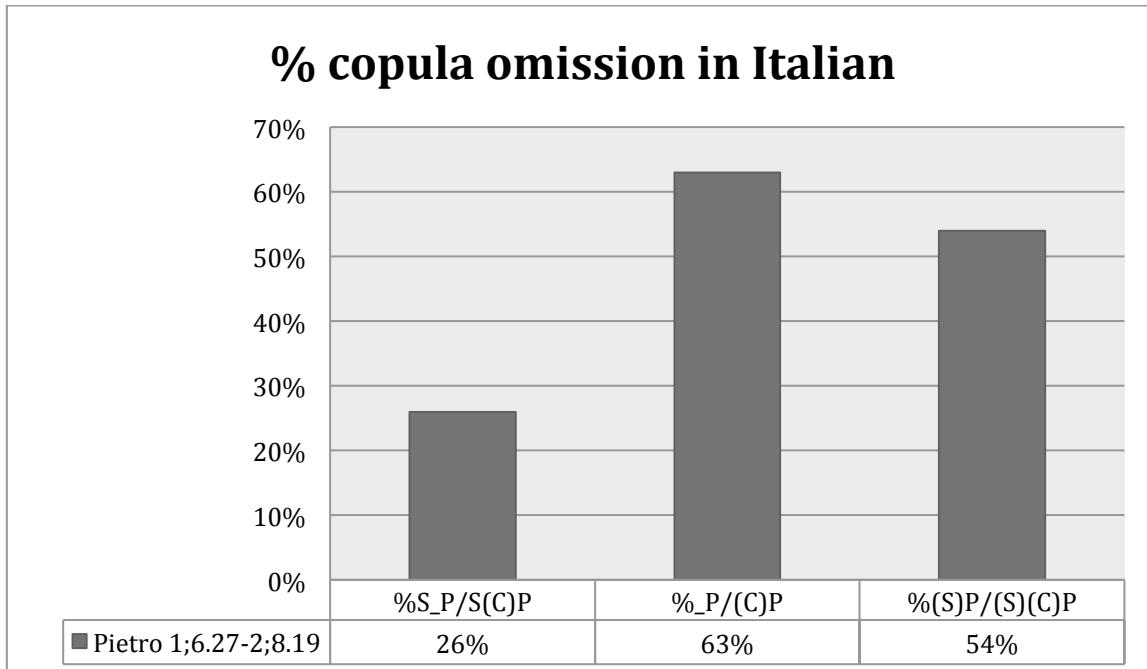

- 81) E' tato. (Pietro 2;1.25)  
 (is boy)  
*He is a boy*

- 82) E' tato che magna a pappa. (Pietro 2;1.8)  
*Is the boy that eats the food*

Now I will observe the development of the copula from a longitudinal perspective more in detail. I will always keep Italian and Dialect separate.

As suggested by Franchi (2004), I used the formulas in (74), (75) and (76) to calculate the percentage of copula omission in contexts with overt subjects ( $S_P/S(C)P$ ), non-overt subjects ( $_P/(C)P$ ) and the total number of omission on the total number of copula contexts ( $(S)P/S(C)P$ ). I have applied those formulas both for Italian and Dialect and I have reported the results in two different graphs ((22) for Italian and (23) for Dialect) and tables ((21) for Italian and table (22) for Dialect).

**Graph 22: percentage of copula omission in Pietro's Italian sentences**

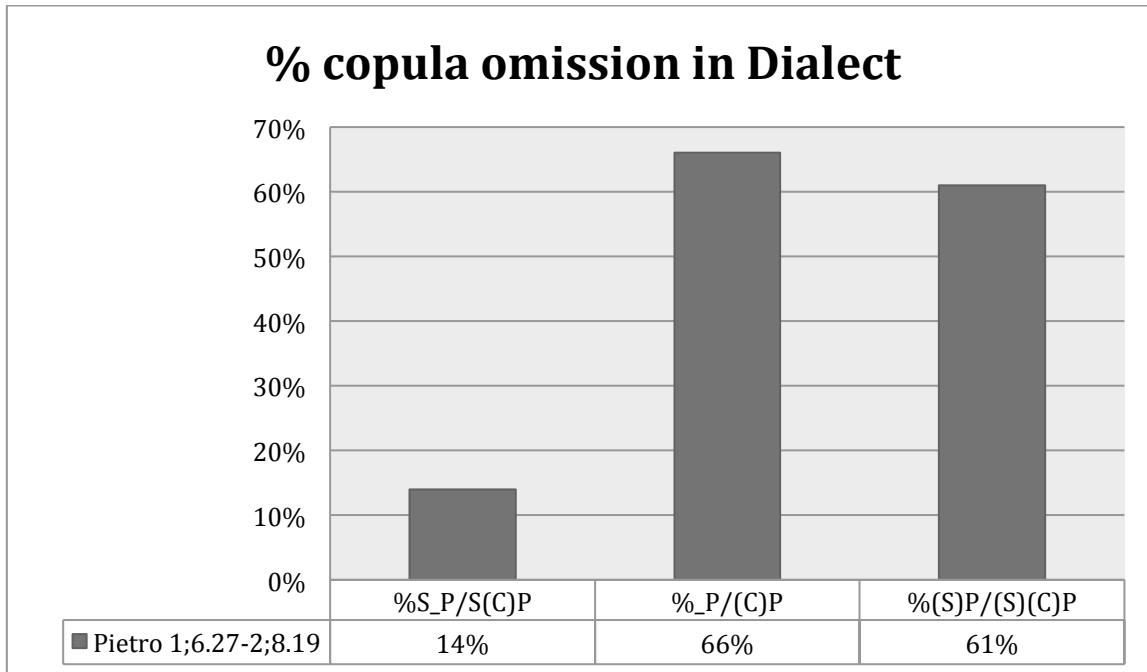

**Table 21: percentage of copula omission in Pietro's Italian sentences**

	Contexts S_P/S(C)P	% S_P/S(C)P	Contexts _P/(C)P	% _P/(C)P	Contexts (S)_P/(S)(C)P	% (S)_P/(S)(C)P
<b>Pietro</b> 1;6.27- 2;8.19	40/154	26%	312/498	63%	352/652	54%

In Pietro's Italian utterances, copular structures are a consistent phenomenon: he produces 652 copular sentences. Omission of the copula is accepted by his grammar: he omits the verb in more than a half of his copular utterances (352/652) and does so in contexts with non-realized subjects (312/498). With overt subjects, he omits the copula in only 26% of cases (40/154). His behavior is similar to Sara's (4.2.1): he produces the copula more often in those contexts that have the subject realized.

Now I will present the Dialect results.

**Graph 23: percentage of copula omission in Pietro's Dialectal sentences**

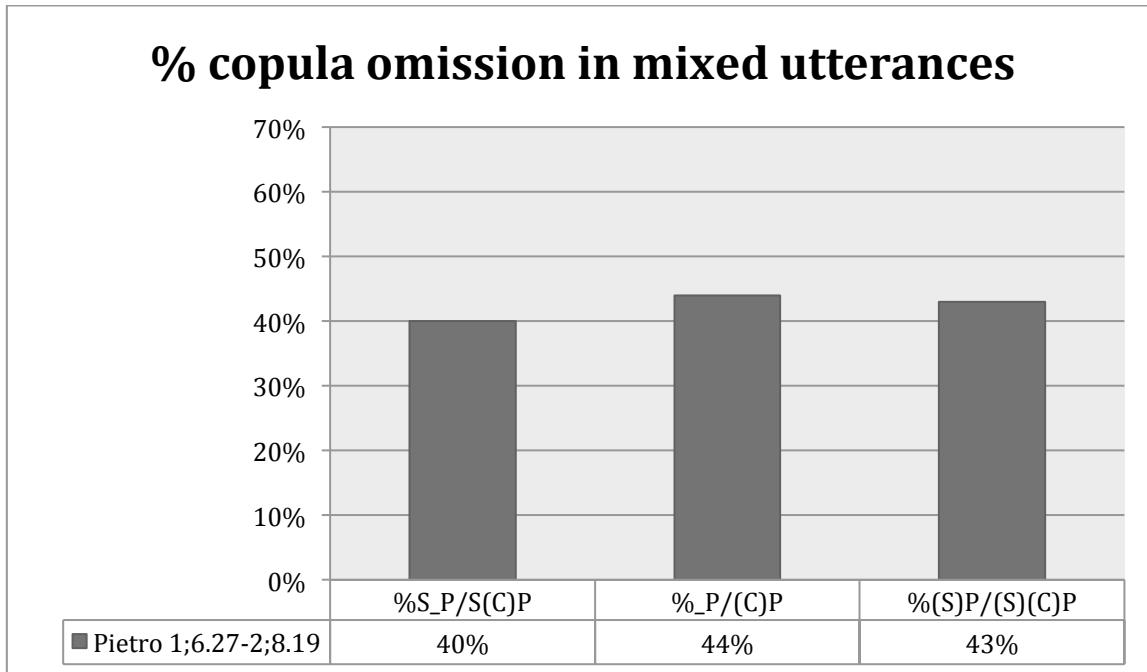

**Table 22:percentage of copula omission in Pietro's Dialectal sentences**

	Contexts S_P/S(C)P	% S_P/S(C)P	Contexts _P/(C)P	% _P/(C)P	Contexts (S)_P/(S)(C)P	% (S)_P/(S)(C)P
<b>Pietro</b> 1;6.27- 2;8.19	1/7	14%	50/76	66%	51/83	61%

In Dialect I have collected only 83 copular contexts. This construction is available also in this language, but his grammar allows the omission of the copula with a quite high percentage: 61%. Pietro omits the copula in only 1 out of 7 cases of constructions with overt subjects. This is the same trend that I have noticed in the Italian results. Similarly to Italian, the highest percentage of omission appears in \_P contexts, those with non-realized subjects.

Graph (24) and table (23) show the data in mixed utterances.

**Graph 24: percentage of copula omission in Pietro's mixed utterances**

**Table 23: percentage of copula omission in Pietro's mixed utterances**

	Contexts S_P/S(C)P	% S_P/S(C)P	Contexts _P/(C)P	% _P/(C)P	Contexts (S)_P/(S)(C)P	% (S)_P/(S)(C)P
<b>Pietro</b> 1;6.27- 2;8.19	2/5	40%	4/9	44%	6/14	43%

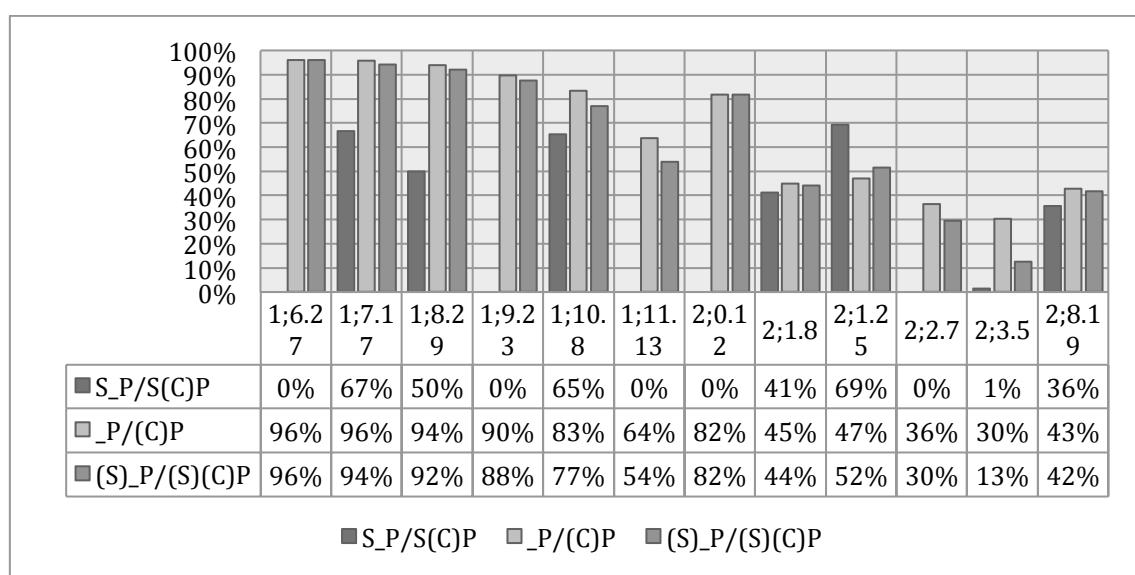

First of all, notice that the copular contexts in mixed utterances are very few: only 14. I have analyzed them, but since the number of cases is very small I am not sure this is a reliable trend. The results are very balanced because the percentage of omission is everywhere around 40%.

In what follows, a detailed view of the development of copula omission is provided. Table (24) and graph (25) show the number and percentage of omissions in Italian for each recording. In graph (26) and table (25) I have done the same for Dialect.

**Table 24: copula omission in number and in percentage for each recording (Pietro, Italian)**

	S_P/S(C)P		_P/(C)P		(S)_P/(S)(C)P	
<b>1;6.27</b>	0/0	-	26/27	96%	26/27	96%
<b>1;7.17</b>	2/3	67%	46/48	96%	48/51	94%
<b>1;8.29</b>	1/2	50%	32	94%	34	92%
<b>1;9.23</b>	0/1	0%	35/39	90%	35/40	88%
<b>1;10.8</b>	15/23	65%	35/42	83%	50/65	77%
<b>1;11.13</b>	0/2	0%	7/11	64%	7/13	54%
<b>2;0.12</b>	0/0	-	18/22	82%	18/22	82%
<b>2;1.8</b>	7/17	41%	27/60	45%	34/77	44%
<b>2;1.25</b>	9//13	69%	24/51	47%	33/64	52%
<b>2;2.7</b>	0/10	0%	16/44	36%	16/54	30%
<b>2;3.5</b>	1/69	1%	13/43	30%	14/112	13%
<b>2;8.19</b>	5/14	36%	33/77	43%	38/91	42%
<b>TOT.</b>	<b>40/154</b>	<b>26%</b>	<b>312/498</b>	<b>63%</b>	<b>352/652</b>	<b>54%</b>

**Graph 25: percentage of copula omission for each recording (Pietro, Italian)**

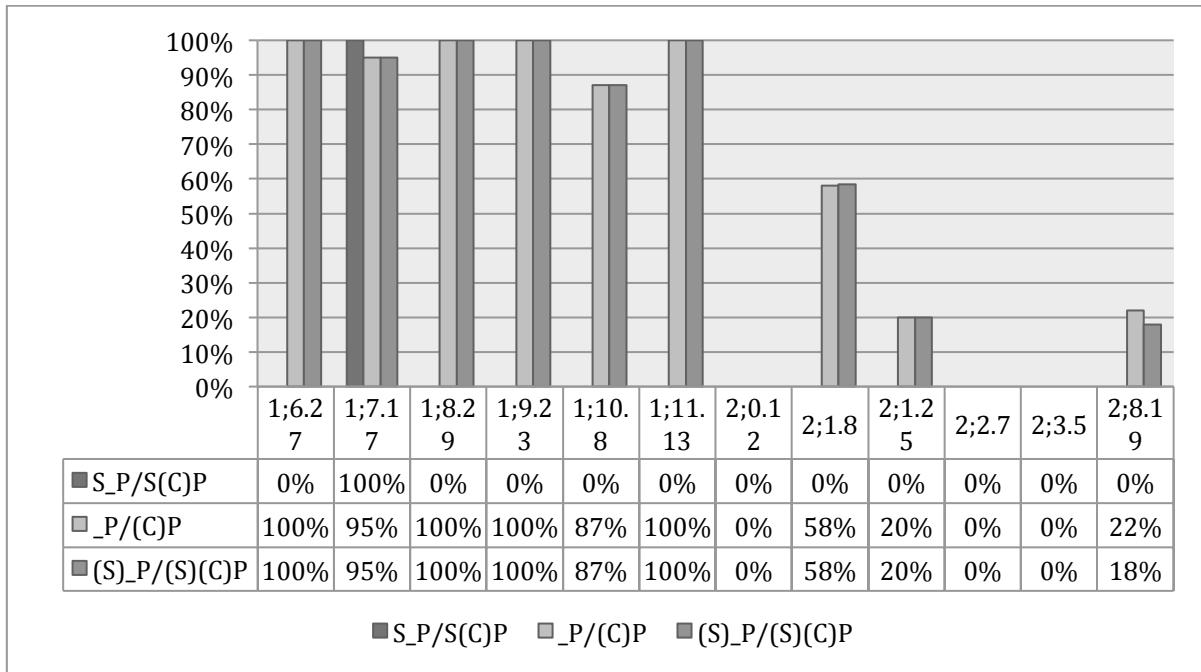

In Pietro's Italian utterances, the copula omission is a consistent phenomenon which is more present at the beginning and decreases in the last recordings. Table (24) and graph (26) report the results regarding Dialect.

**Table 25: copula omission in number and in percentage for each recording (Pietro, Dialect)**

	S_P/S(C)P		_P/(C)P		(S)_P/(S)(C)P	
<b>1;6.27</b>	0/0	-	4/4	100%	4/4	100%
<b>1;7.17</b>	1/1	100%	20/21	95%	21/22	95%

<b>2;8.19</b>	0/4	0%	4/18	22%	4/22	18%
<b>TOT.</b>	<b>1/7</b>	<b>14%</b>	<b>50/76</b>	<b>66%</b>	<b>51/83</b>	<b>61%</b>

**Graph 26: copula omission in percentage for each recording (Pietro, Dialect)**

The Dialect's trend is a little bit different from the Italian's one: the percentage of omissions in the first half of the graph is very high, and then it decreases. However, there are recordings where the omission is 0%; in those cases, Pietro produces very few contexts (1 CP at 2;0.12, none at 2;2.7 and 2 SCP at 2;3.5). The omission trend is fundamentally influenced by copula omission in the \_P context, because Pietro omits the copula only once in sentences with overt subjects.

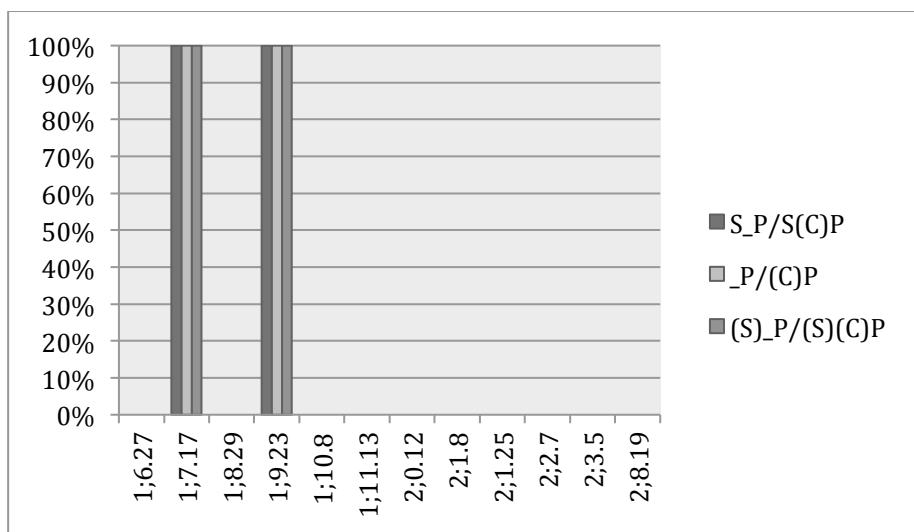

The next table (26) and graph (27) show copula omissions in mixed sentences. Even though the contexts are few, as I have said before, they can be used to see the trend.

**Table 26: copula omission in number and in percentage for each recording (Pietro, mixed utterances)**

	S_P/S(C)P	_P/(C)P	(S)_P/(S)(C)P
1;6.27	0/0	-	0/0

<b>1;7.17</b>	1/1	100%	1/1	100%	2/2	100%
<b>1;8.29</b>	0/0	-	0/0	-	0/0	-
<b>1;9.23</b>	1/1	100%	3/3	100%	4/4	100%
<b>1;10.8</b>	0/0	-	0/0	-	0/0	-
<b>1;11.13</b>	0/1	0%	0/1	0%	0/2	0%
<b>2;0.12</b>	0/0	-	0/0	-	0/0	-
<b>2;1.8</b>	0/2	0%	0/1	0%	0/3	0%
<b>2;1.25</b>	0/0	-	0/2	0%	0/2	0%

<b>2;3.5</b>	0/0	-	0/0	-	0/0	-
<b>2;8.19</b>	0/0	-	0/1	0%	0/1	0%
<b>TOT.</b>	2/5	40%	4/9	44%	6/14	43%

**Graph 27: copula omission in percentage for each recording (Pietro, mixed utterances)**

It is easy to notice that the trend here does not have a gradual evolution. The important thing to point out is that omissions in mixed utterances stop when, analyzing the MLU, Italian starts to be the *Stronger Language* (2.3), at 1:10.8.

From now on, since the constructions in mixed utterances are so few, I will not take them into consideration for the following analysis.

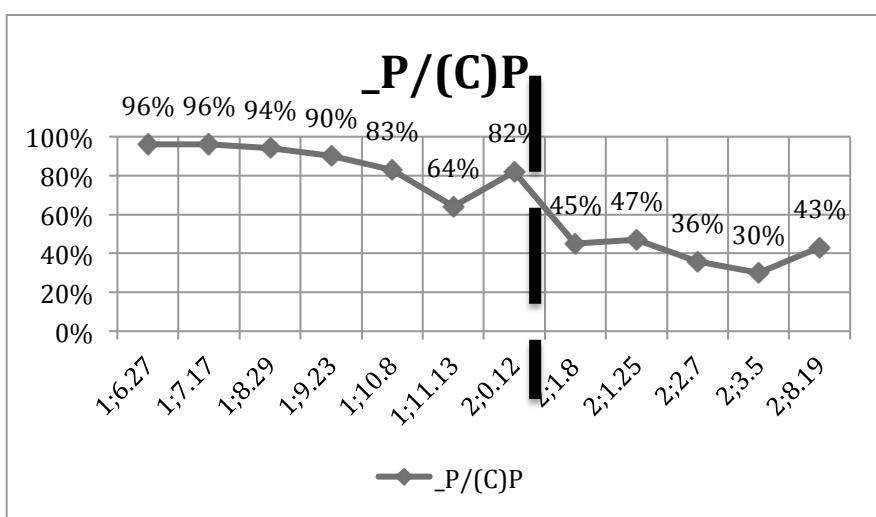

### 5.1.1 Two stages in copula omission

As I did for Sara in section 4.2.1, I will now identify if there is a *cut* separating the *first stage* from the *second* one, in Pietro's copular productions. The first language I am going to analyze is Italian, then Dialect will follow.

In graphs (28), (29) and (30) the three different cases I have previously investigated are represented in all the recordings: omissions with non-overt subjects (\_P), the total amount of omissions, omissions with overt subjects (S\_P). In each graph I have underlined the *cut* point.

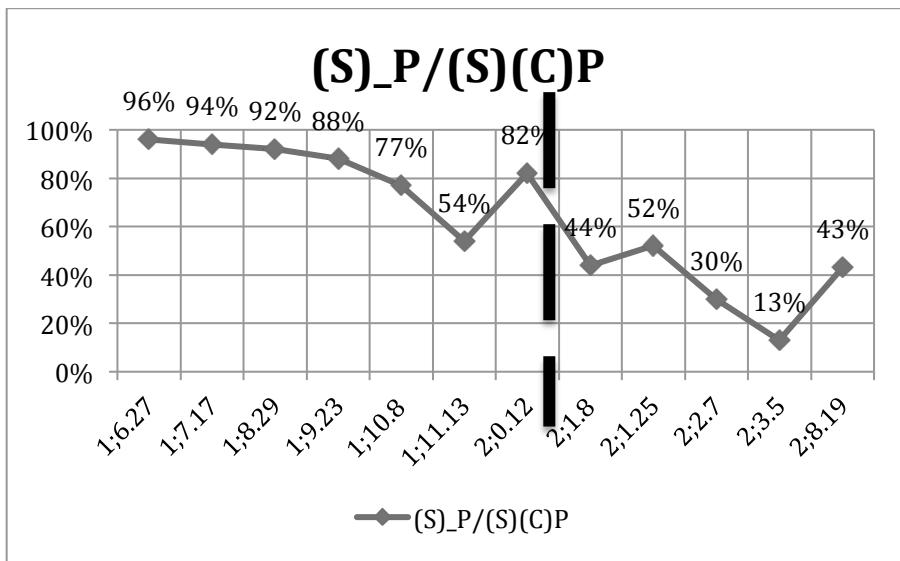

In graph (28), there is a clear change in the percentage of omissions between 2;0.12 and 2;1.8. In fact, before that point the value never goes under 64%, instead, after that point it swings from 47% to 30%. I have identified this as the *cut* between the two stages (Franchi, 2004). Also Cecchin (2009), in her research about Pietro, found such point as the separation of the stages.

**Graph 28: copula omission in utterances with non-realized subjects and the cut point between the two stages (Pietro, Italian)**

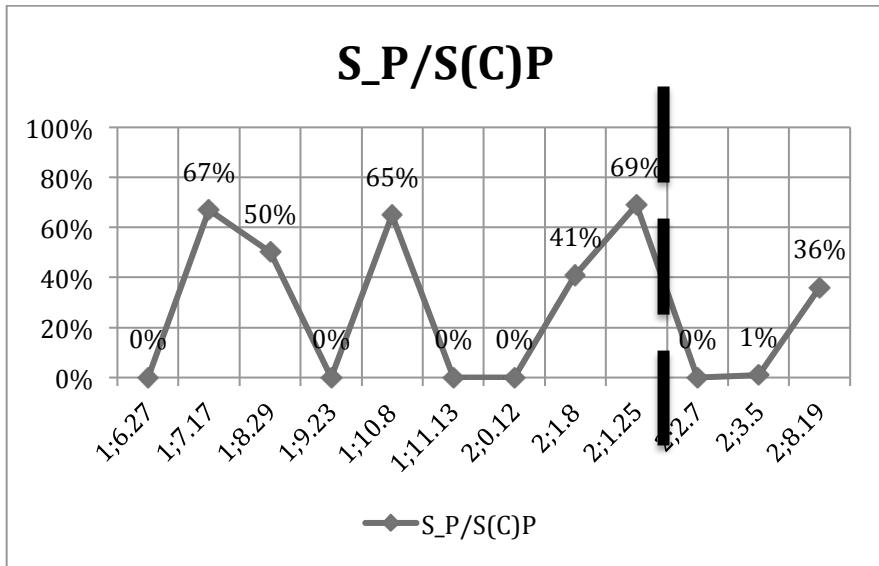

Considering the total percentage of copula omissions (graph 29), the *cut* can be located at the same age as in graph (28). In the first stage, indeed, the percentage is included within 54% and 96%, whereas in the second stage it goes from 52% to 13%.

**Graph 29: total percentage of copula omission and the cut point between the two stages (Pietro, Italian)**

Graph (30) represents the percentage of omissions in contexts with realized subjects.

**Graph 30: contexts with overt subjects and the cut point between the two stages (Pietro, Italian)**

This case shows the most irregular trend, however omissions never reach 100%. It is not gradual, in fact, the values jump from 0% to 67% or 69%. Notice, however, that from 2;1.25 on, the value of omissions never goes higher than 36%.

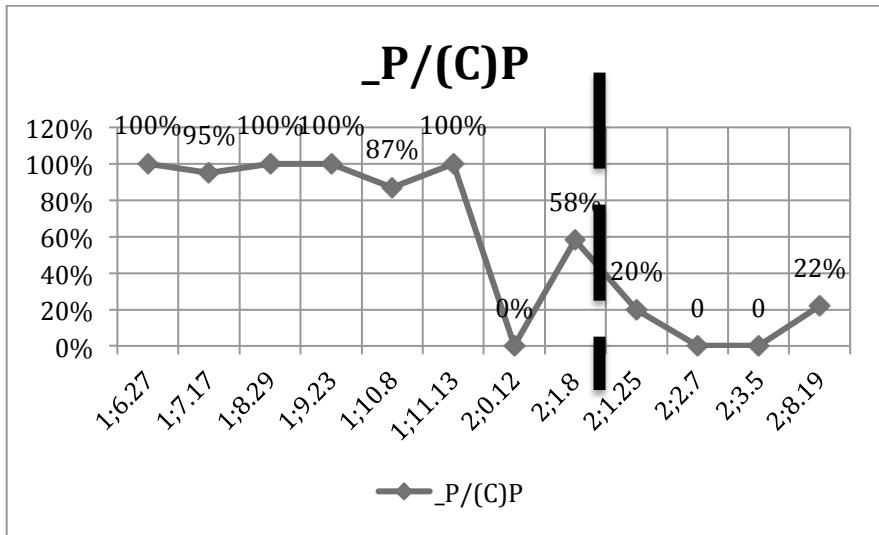

I therefore suppose that the *cut* here is a little bit later. This is the same conclusion found by Cecchin (2009). As we said for Sara, there could not be two different *cut* points, hence, I suggest that this one is the most reliable. The contexts with non-realized subjects (\_P) can, indeed, include elliptical structures, while S\_P contexts refer to the "pure" contexts of copula omission.

The cut between the *two stages* now identified (2;1.25-2;2.7) is very similar to the points found by Franchi (2004) and reported in table (9) (section 4.2.1).

In the following section, I will do the same analysis for the Dialect utterances. The trend of copula omissions in the Dialect sentences with non-overt subjects (graph 31) is very high at the beginning (between 100% and 87%), then it reaches 0%, and then it goes up again at 58%. From 2;1.25 on, instead, it remains quite low: it never goes beyond 22%.

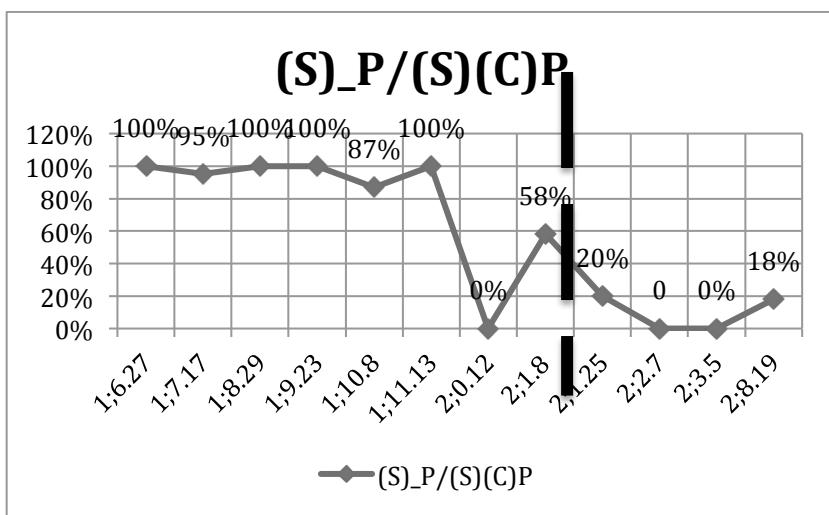

The *cut* between the *two stages* has been situated between 2;1.8 and 2;1.25, i.e. close to where the Italian *cut* point is ( 2;1.25 and 2;2.7).

**Graph 31: copula omission in utterances with non-realized subjects and the cut point between the two stages (Pietro, Dialect)**

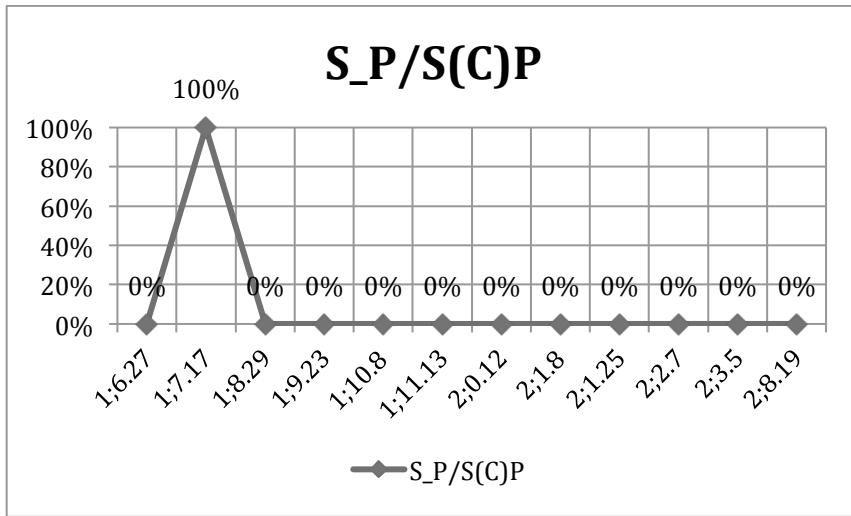

Most of the Dialect contexts are sentences without subject (72 out of 83). It is therefore rather intuitive that in the graph below, showing the total amount of omissions, there is approximately the same trend found before. And also here, the *cut* point is between 2;1.8 and 2;1.25.

**Graph 32: total percentage of copula omission and the cut point between the two stages (Pietro, Dialect)**

In graph (33), the trend is quite different from the previous ones. These sentences are only 7 and they display only one copula omission at 1;7.17; in the other 6 cases, produced in the last two recordings, the copula is realized.

**Graph 33: contexts with overt subjects and the cut point between the two stages (Pietro, Dialect)**

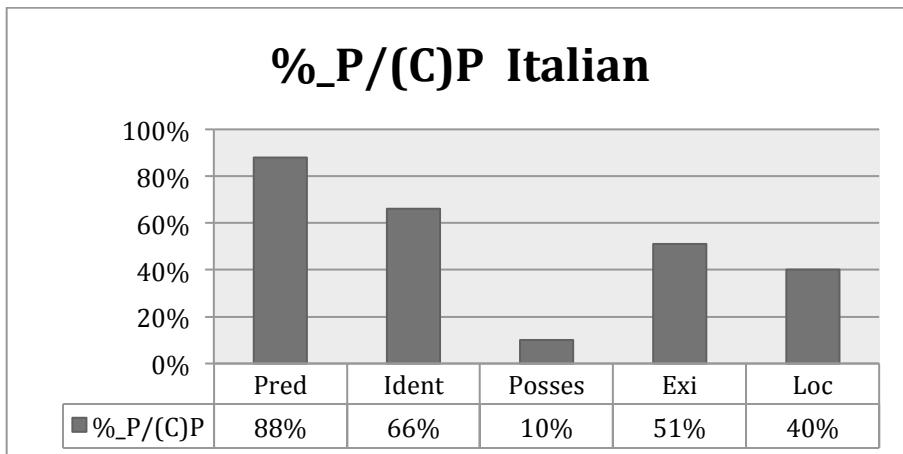

In this case, it is difficult to draw the *cut* between the *two stages*. Notice that the 6 productions are realized in the period of time that I have previously defined as the *second stage*. I can therefore conclude that Pietro tends to produce the copula when he realizes sentences with overt subjects.

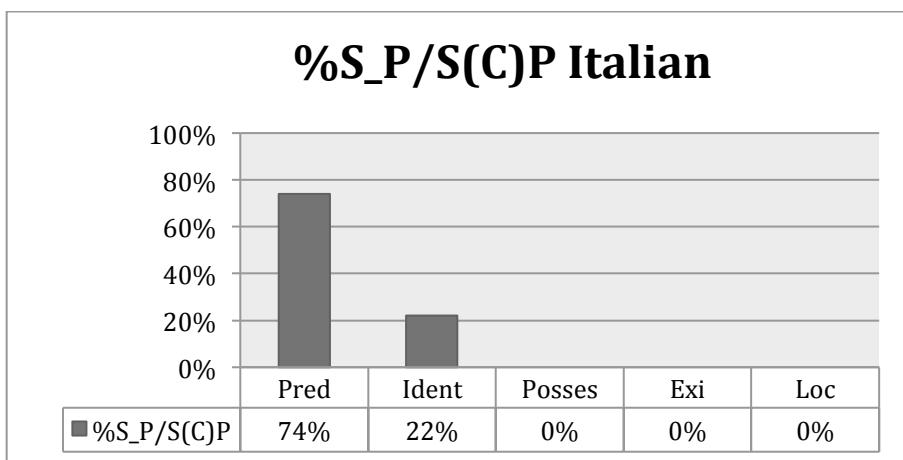

### 5.1.2 Effects of grammatical or semantic class of the predicate on copula omission

In this section, I will examine Pietro's omissions in order to see if they are realized more often in some semantic contexts rather than in others. I am using the classes defined by Franchi (2004), as I did for Sara in 4.2.1. In graphs (34) and (35), the Italian data are reported: the contexts with non-realized subjects ( $_P/(C)P$ ) and those with overt subjects ( $S_P/S(C)P$ ). Graphs (36) and (37) show the results about Dialect.

**Graph 34: percentage of copula omission in contexts with non-overt subjects (Pietro, Italian)**

**Graph 35: copula omissions in contexts with overt subjects (Pietro, Italian)**

**Table 27: number and percentage of copula omission in each category**

	-_P/(C)P		S_P/S(C)P	
<b>Predicative</b>	153/173	88%	20/27	74%
<b>Identificative</b>	195/297	66%	18/81	22%
<b>Possessive</b>	3/29	10%	0/3	0%

<b>Existential</b>	18/35	51%	0/16	0%
<b>Locative</b>	16/40	40%	0/24	0%

The following examples show Pietro's sentences for each class.

*Predicative*

- 83) B(r)ut(t)o (\_P) (Pietro 1;9.23)  
*(ugly)*  
*It is ugly*

- 84) Que(s)to (è) rosso (S\_P) (Pietro 1;11.13)  
*This (is) red*

*Identificative*

- 85) (le)oni (\_P) (Pietro 1;9.23)  
*(lions)*  
*These are lions*

- 86) Que(s)ta (è la) giraffa (S\_P) (Pietro 2;2.5)  
*This (is the) giraffe*

*Possessive*

- 87) è mia (CP) (Pietro 1;10.8)  
*(is mine)*  
*(This) is mine*

*Existential*

- 88) non c'è (CP) (Pietro 2;3.5)  
*(It) is not there*

*Locative*

- 89) (sono) sotto (\_P) (Pietro 1;9.23)

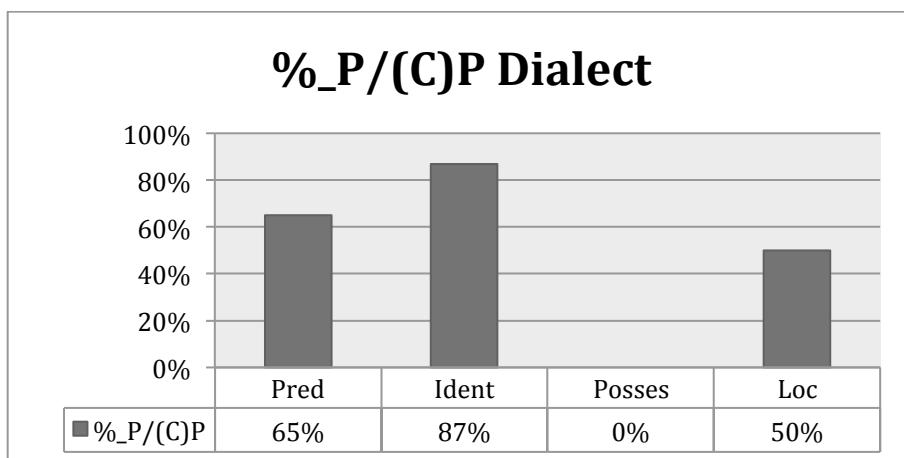

*(are) underneath*

*(They are) underneath*

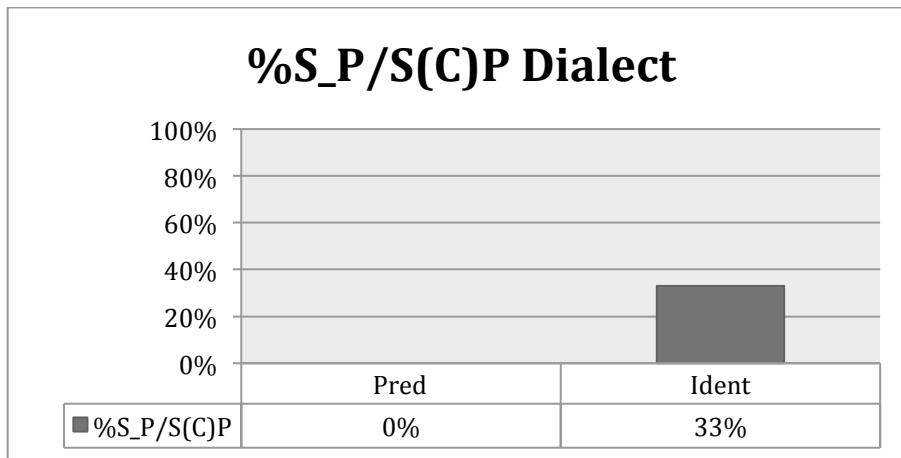

In 4.1, I have described the work by Becker (2000), who found a trend in English where the copula was omitted more often with Locative Predicates than with Nominal Predicates.

My results do not confirm this study, but I can also say, as Franchi (2004) did, that the percentage of omission are unpredictable, and it seems that there is not a precise trend.

**Graph 36: percentage of copula omission in contexts with non-overt subjects (Pietro, Dialect)**

**Graph 37: copula omissions in subject realized contexts (Pietro, Dialect)**

**Table 28: number and percentage of copula omission in each category**

	-P/(C)P		S_P/S(C)P	
<b>Predicative</b>	22/34	65%	0/4	0%
<b>Identificative</b>	76/87	87%	1/3	22%
<b>Possessive</b>	0/4	0%	0/0	-
<b>Existential</b>	0/0	-	0/0	-
<b>Locative</b>	1/2	50%	0/0	-

Looking at the Dialect, the number of contexts was very low with respect to Italian, and sometimes there was not even a single context produced for some categories. *Existentials* are missing in graph (36), and *Possessives*, *Locatives* and *Existentials* in graph (37).

In Dialect the percentage of omission in Locative Predicates is quite high but notice that Pietro pronounced only 2 Locative contexts with non-overt subjects.

Below, the examples show Pietro's omissions in Dialect in each class.

#### *Predicative*

- 90) (zé) beo [=è bello] (Pietro 1;7.17)  
*(is) beautiful*

*(It is) beautiful*

*Identificative*

91) (zé un) omo [=uomo] (Pietro 1;10.8)

*(He is a) man*

92) a queo muca [=quella (è una) mucca] (Pietro 1;7.17)

*That one (is) a cow*

*Locative*

93) soto eto [=sotto letto] (Pietro 1;9.23)

*under bed*

*(It is) under (the) bed*

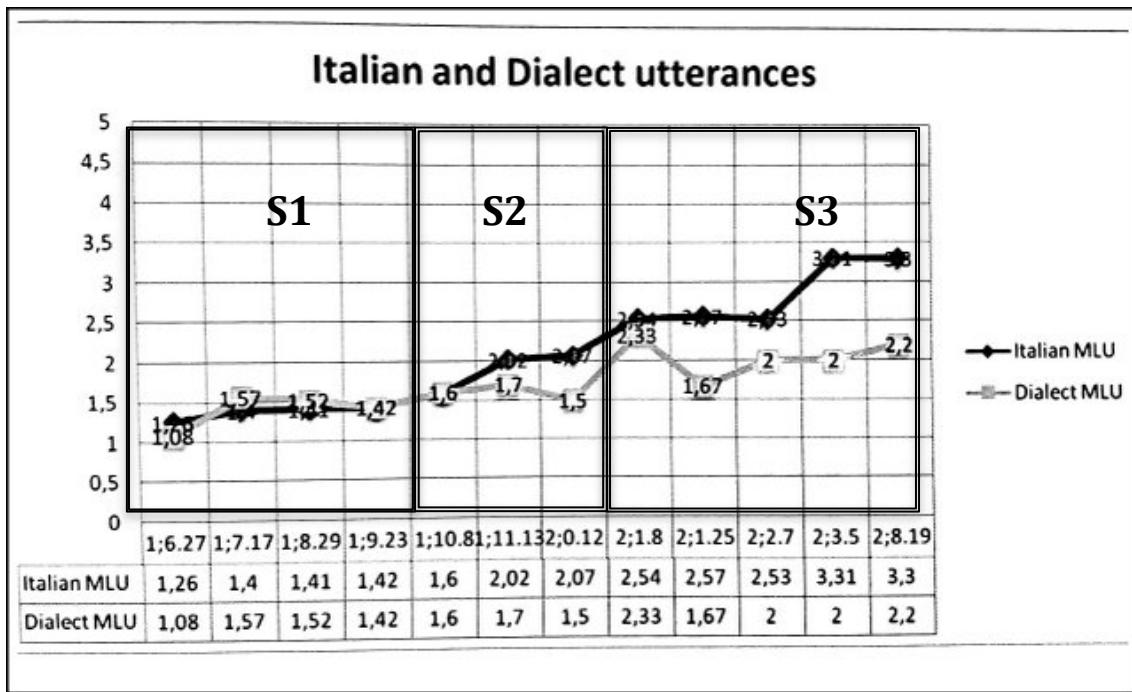

In conclusion, I suggest that Becker's (2000) observations for English are not replicated in the Dialect either, and no particular trend in copula omissions can be identified.

### 5.1.3 Focusing on agreement

In this section, I am going to observe the copulas produced by Pietro in order to check whether there are agreement errors or not.

In graph (38) Pietro's MLU is illustrated. I have divided the utterances in three different stages according to the MLU values suggested by Caprin and Guasti (2006). The first 4 recordings belong to Stage 1, then I gathered the three in the middle to build Stage 2 and the last five recordings compose Stage 3.

**Graph 38: Pietro's MLU divided into Caprin and Guasti's stages**

In table (29), I have listed the Italian structures with overt copulas, divided into the three stages according to the MLU values.

**Table 29: number of correct/wrong forms in Pietro's corpus, Italian**

ITALIAN	Correct forms	Wrong forms	Total structures
Pietro S1	13	/	13
Pietro S2	25	/	25
Pietro S3	221	12	233
<b>Tot.</b>	<b>259</b>	<b>12</b>	<b>271</b>

In "Pietro S1" the contexts where the copula is realized are only 13, they are all correct. All of them are 3<sup>rd</sup> person singular forms.

In "Pietro S2" the copula is realized in 25 constructions, always correct and always in the 3<sup>rd</sup> person singular.

The last group "Pietro S3" includes the last 5 recordings and the highest number of sentences with the copula realized: 233. Only 12 wrong forms can be found (3 in declarative sentences and 9 in Wh questions), and all mistakes have the same origin: Pietro used the 3<sup>rd</sup> person singular instead of the plural one. Probably, these mistakes are due to an influence by Dialect, because in this language there are no 3<sup>rd</sup> person plural forms of the verb *to be*, as shown in section 3.1.

So, if I compare Pietro productions in Italian with the result found by Caprin and Guasti (2006) I may say that the percentage of accuracy with the 3<sup>rd</sup> person singular is in all the three groups 100% (as in Caprin and Guasti). The 3<sup>rd</sup> person plural is never produced in S1 and S2, while in S3 there are 26 cases, 12 are wrong but the remaining 14 are correctly produced. The percentage of correctness is 46%, which is rather different from the 96% reported in Caprin and Guasti (2006), see table (3).

**Table 30: number of correct/wrong forms in Pietro's corpus, Dialect**

DIALECT	Correct forms	Wrong forms	Total structures
Pietro S1	1	/	1
Pietro S2	2	/	2
Pietro S3	29	/	29
Tot.	32	/	32

In Dialect I have counted very few productions of the copula, only 32. In "Pietro S1" there is just 1 copular sentence and it is correct. In "Pietro S2" the utterances are 2, and both are correct. One of them shows a proper use of the 3<sup>rd</sup> person plural.

In the third group "Pietro S3", there are 29 sentences, which are all correct. Among them there are 5 constructions with the 3<sup>rd</sup> person plural, as in (94a), and 1 with the 2<sup>nd</sup> person singular, as in (94b).

- 94) a. (i) zé [=sono] rotti [Pietro 2;0.12]  
*(They) are broken*
- b. (s)ito [=sei] matto? [Pietro 2;1.8]  
*Are you crazy?*

### 5.1.4 Declaratives versus Wh contexts

In this section, the Wh productions of Pietro are analyzed to check whether he shows different omission percentages in different clause types.

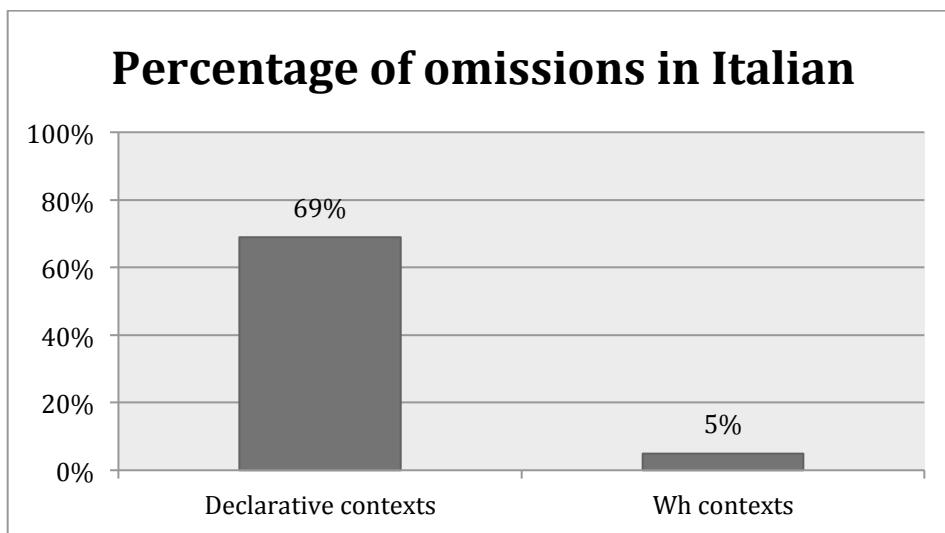

I collected 161 Wh contexts in Pietro's tables reported in Cecchin (2009), 152 are pronounced in Italian and 9 in Dialect. In table (31) I have reported the number and percentage of omissions in Italian, whereas in table (32) I have reported the data about Dialect.

**Table 31: copula omission in Wh contexts (Pietro, Italian)**

	Contexts	Omissions	Productions	%Omission
<b>1;6.27</b>	-	-	-	-
<b>1;7.17</b>	-	-	-	-
<b>1;8.29</b>	6	3	3	50%
<b>1;9.23</b>	5	3	2	60%
<b>1;10.8</b>	8	0	8	0%
<b>1;11.13</b>	-	-	-	-
<b>2;0.12</b>	2	0	2	0%
<b>2;1.8</b>	22	0	22	0%
<b>2;1.25</b>	13	0	13	0%
<b>2;2.7</b>	24	1	23	4%
<b>2;3.5</b>	57	0	57	0%
<b>2;8.19</b>	15	0	15	0%
<b>TOT.</b>	<b>152</b>	<b>7</b>	<b>145</b>	<b>5%</b>

In graph (39), I have represented the percentage of omission in Italian declarative sentences and in Italian Wh contexts.

**Graph 39: percentage of omissions in Wh contexts versus declarative sentences (Pietro, Italian)**

The total amount of Wh copular contexts in Italian is 152, Pietro omits the verb only 7 times, and 6 of them are produced in early recordings. The percentage of omission in Wh questions is very low, confirming Franchi's observation that while omission of the copula in declarative contexts happens quite often, the omission of the verb in Wh questions is not allowed in early grammar. In this case the *cut* line between the *two stages* can be placed between 1;9.23 and 1;10.8 because from that moment on, the cases of omission drastically decrease and only one more omission is found.

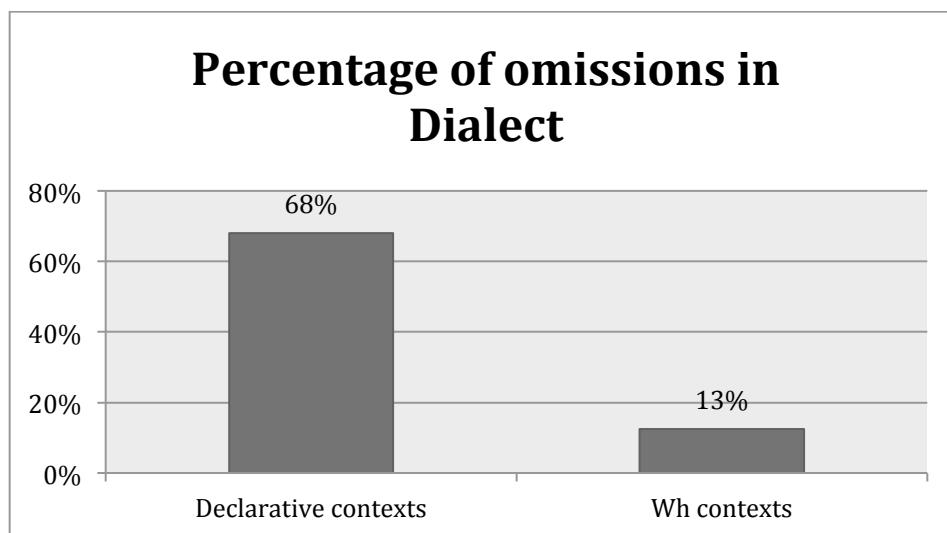

**Table 32: copula omission in Wh contexts (Pietro, Dialect)**

	Contexts	Omissions	Productions	%Omission
<b>1;6.27</b>	-	-	-	-
<b>1;7.17</b>	1	0	1	0%

<b>1;8.29</b>	1	1	0	100%
<b>1;9.23</b>	-	-	-	-
<b>1;10.8</b>	-	-	-	-
<b>1;11.13</b>	-	-	-	-
<b>2;0.12</b>	-	-	-	-
<b>2;1.8</b>	3	0	3	0%
<b>2;1.25</b>	-	-	-	-
<b>2;2.7</b>	-	-	-	-
<b>2;3.5</b>	-	-	-	-
<b>2;8.19</b>	4	0	4	0%
<b>TOT.</b>	<b>9</b>	<b>1</b>	<b>8</b>	<b>13%</b>

The graph below shows the percentage of omissions in declarative sentences and Wh contexts realized in Dialect.

**Graph 40: percentage of omissions in Wh contexts versus declarative sentences (Pietro, Dialect)**

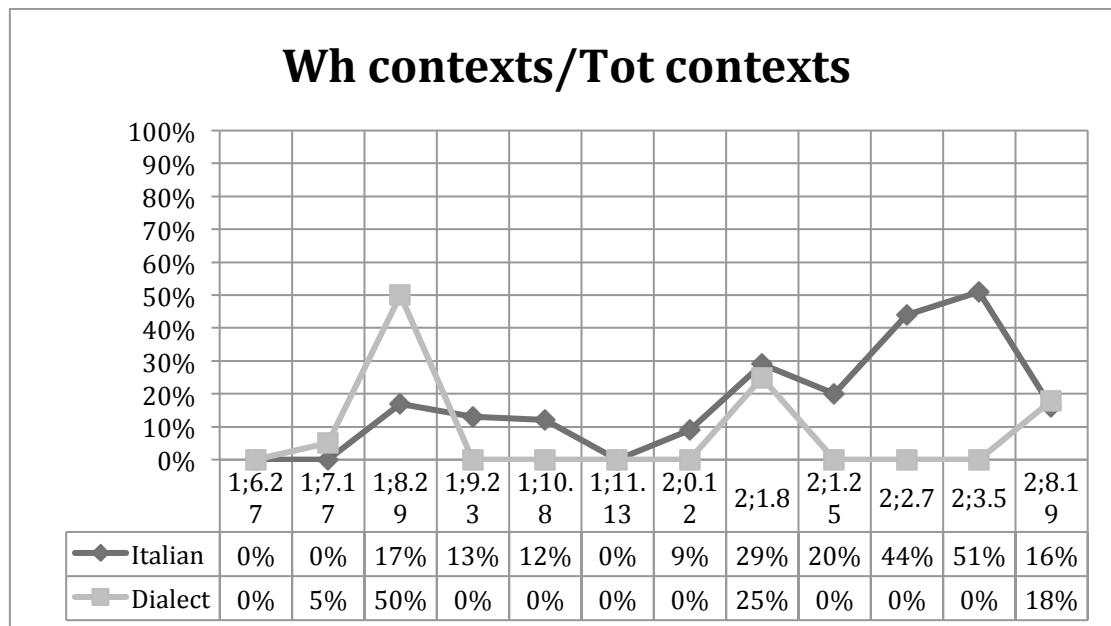

In Dialect Pietro only produced 9 Wh questions. The number is not high enough in order to see a trend, but since only 1 omission was produced, it is

possible to claim that Pietro's grammar does not allow the omission of the copula in Wh contexts in this language either.

Tables (31) and (32) show that the number of Wh sentences in Italian increases a lot in the last recordings (see graph 41). The Dialectal trend is however not so regular.

The Wh contexts in Italian are a significant percentage of the total amount of copular sentences, and they show the realization of the verb in the vast majority of cases. Thus, I have re-considered the omission of the copula in Italian, counting only the declarative sentences, in order to see if the Wh questions have influenced my previous results, see table (33).

**Graph 41: percentage of Wh contexts in relation to the total amount of copula contexts for each recording (Pietro, Italian and Dialect)**

The table below shows the percentage of copula omission in declarative contexts. I have also reported table (24), repeated here as (33b), to compare the percentages of all contexts together more easily (Declaratives + Wh)

**Table 33: percentage of copula omission in Declarative contexts (Pietro, Italian)**

	S_P/S±CP		_P/±CP		(S)_P/(S)(C)P	
1;6.27	0/0	-	26/27	96%	26/27	96%
1;7.17	2/3	67%	46/48	96%	48/51	94%
1;8.29	1/1	100%	29/29	100%	30/30	100%
1;9.23	0/1	0%	32/34	94%	32/35	91%
1;10.8	15/16	94%	35/41	85%	50/57	88%
1;11.13	0/2	0%	7/11	64%	7/13	54%
2;0.12	0/0	-	18/20	90%	18/20	90%
2;1.8	7/7	100%	27/48	56%	34/55	62%
2;1.25	9/13	69%	24/38	63%	33/51	65%
2;2.7	0/4	0%	15/26	58%	15/30	50%

2;8.19	5/13	38%	33/63	52%	38/76	50%
<b>TOT.</b>	<b>40/88</b>	<b>46%</b>	<b>305/412</b>	<b>74%</b>	<b>345/500</b>	<b>69%</b>

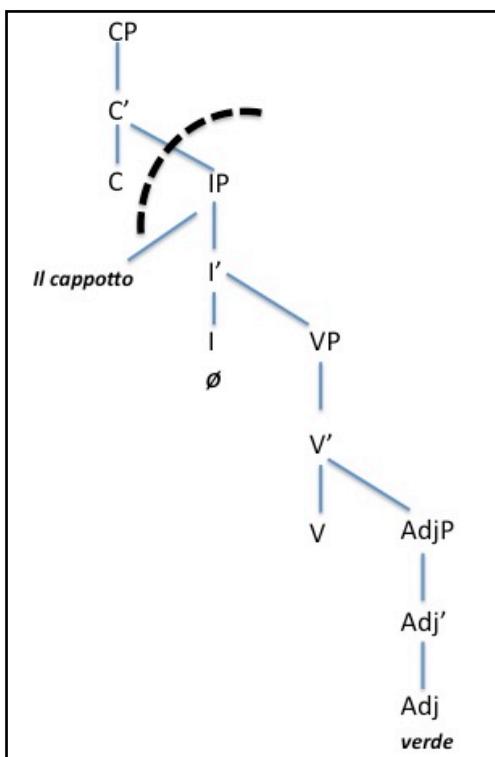

**Table 33b: omission of the copula in all contexts (Pietro, Italian)**

	S_P/S(C)P		_P/(C)P		(S)_P/(S)(C)P	
<b>1;6.27</b>	0/0	-	26/27	96%	26/27	96%
<b>1;7.17</b>	2/3	67%	46/48	96%	48/51	94%
<b>1;8.29</b>	½	50%	32	94%	34	92%
<b>1;9.23</b>	0/1	0%	35/39	90%	35/40	88%
<b>1;10.8</b>	15/23	65%	35/42	83%	50/65	77%
<b>1;11.13</b>	0/2	0%	7/11	64%	7/13	54%
<b>2;0.12</b>	0/0	-	18/22	82%	18/22	82%
<b>2;1.8</b>	7/17	41%	27/60	45%	34/77	44%
<b>2;1.25</b>	9//13	69%	24/51	47%	33/64	52%

<b>2;2.7</b>	0/10	0%	16/44	36%	16/54	30%
<b>2;3.5</b>	1/69	1%	13/43	30%	14/112	13%
<b>2;8.19</b>	5/14	36%	33/77	43%	38/91	42%
<b>TOT.</b>	<b>40/154</b>	<b>26%</b>	<b>312/498</b>	<b>63%</b>	<b>352/652</b>	<b>54%</b>

The percentage of omission of the copula in declarative contexts is higher, especially in contexts with realized subjects (46%). This consistent omission in S\_P contexts means that the structure is truncated above IP and the copula in I is not realized, as shown in (95).

95)

While in \_P contexts, the structure is elliptical, as I suggested before. Omissions values in declarative contexts (table (33)) are higher than Franchi's result (see table 1 and 2), especially in sentences with overt subjects.

### 5.1.5 Articles

In this section, I will briefly consider the production of articles in Pietro's copular contexts, both in Italian and Dialect. I counted all the contexts that would require the use of the article in an adult grammar and I listed productions and omissions. In Italian, I have counted 264 situations, of which only 67 display an overt article. In Dialect, the situations requiring the article were only 40, and the articles produced were only 11. In (96), (97), (98) and (99) I reported some examples of Pietro's use of the articles.

#### *Articles omission*

##### 96) ITALIAN

- Bici [=mici=gatti] (Pietro 1;7.17)  
*cats*  
*The cats.*

##### 97) DIALECT

- Omo [=uomo] (Pietro 1;10.8)  
*man*  
*The man*

#### *Articles production*

##### 98) ITALIAN

- Qua c'è l'osso. (Pietro 2;3.5)  
*Here there is the bone*

##### 99) DIALECT

- a boto [=moto] (Pietro 2;1.8)  
*The motorbike*

If Pietro is compared to Sara (4.2.4), it can be easily seen that there is a big difference in the percentage of produced articles (Sara: 89%).

**Table 34: percentage of article use in Italian and Dialect**

	ITALIAN	DIALECT
<b>S_P</b>	15%	0%
<b>_P</b>	17%	17%
<b>SCP</b>	41%	67%
<b>CP</b>	49%	67%
<b>Tot.</b>	<b>25%</b>	<b>28%</b>

In conclusion, Pietro has not yet developed a full competence about articles at this stage, but he will surely improve, given that in the last recordings the number of articles produced increases.

## 5.2 Marco

The data about Marco are taken from the corpus collected and transcribed by Fabris (2010). In his first recording, this child was 2;0.17 and in his last one 3;0.0.

I counted all the copula constructions both in Italian and in Dialect, and I reported them in table (35) and (36) following the organization proposed by Franchi. I have also found some copular contexts in mixed utterances, and I described them in table (37).

**Table 35: Marco's copular contexts in Italian**

	COPULA OMISSION		COPULA PRODUCTION	
	S_P contexts	_P contexts	SCP contexts	CP contexts
<b>2;0.17</b>	4	23	0	1
<b>2;0.29</b>	0	21	0	2
<b>2;1.13</b>	1	28	1	1
<b>2;1.26</b>	1	24	4	5
<b>2;2.11</b>	0	10	1	6
<b>2;3.0</b>	0	7	2	4

<b>2;3.14</b>	2	1	7	15
<b>2;3.29</b>	0	3	6	4
<b>2;4.10</b>	1	1	1	6
<b>2;4.19</b>	1	4	0	4
<b>2;5.9</b>	0	1	2	0
<b>2;6.19</b>	0	0	8	4
<b>2;7.4</b>	0	1	1	1
<b>2;7.29</b>	0	1	3	3
<b>2;8.11</b>	0	2	2	10
<b>2;8.29</b>	0	0	4	4
<b>2;9.13</b>	0	2	11	4
<b>2;10.3</b>	0	1	1	4
<b>2;10.20</b>	0	0	5	1
<b>2;11.11</b>	0	0	7	4
<b>3;0.0</b>	1	0	6	7
<b>Tot.</b>	<b>11</b>	<b>130</b>	<b>72</b>	<b>90</b>
<b>Tot.</b>	<b>141</b>		<b>162</b>	
<b>Tot.</b>	<b>303</b>			

Marco produces 303 copular structures in Italian, and he produces the copula in 162 cases, whereas its omission involves 141 cases. The S\_P constructions are only 11, the \_P ones are many more: 130. The number of structures where the copula is realized is almost the same in the two contexts (72 and 90, respectively).

The following graph shows the percentage values of productions and omissions.

**Graph 42: Marco's Italian copular contexts**

The percentage of Marco's productions and omissions is very balanced, although he produces the copula in slightly more contexts.

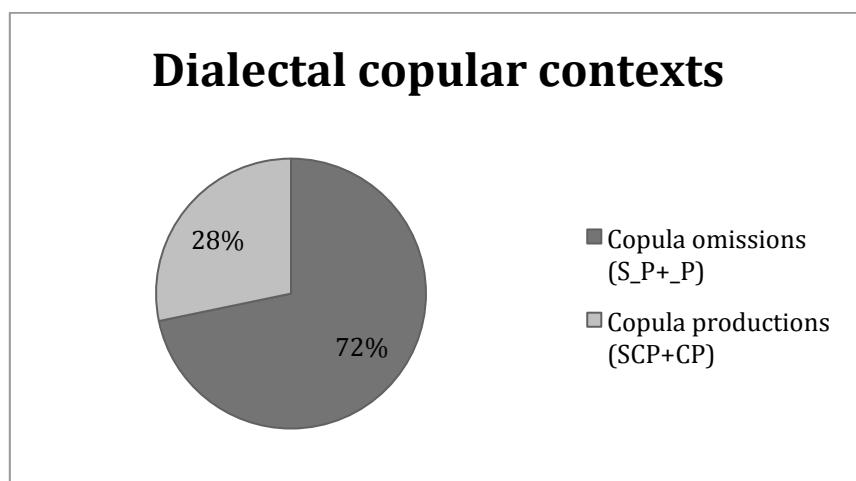

**Table 36: Marco's copular contexts in Dialect**

	COPULA OMISSION		COPULA PRODUCTION	
	S_P contexts	_P contexts	SCP contexts	CP contexts
<b>2;0.17</b>	1	8	0	0
<b>2;0.29</b>	0	11	0	0
<b>2;1.13</b>	0	8	0	0
<b>2;1.26</b>	0	3	0	1
<b>2;2.11</b>	0	0	1	0
<b>2;3.0</b>	0	1	0	0
<b>2;3.14</b>	0	0	0	0
<b>2;3.29</b>	0	1	0	0
<b>2;4.10</b>	0	0	0	0
<b>2;4.19</b>	0	0	0	3
<b>2;5.9</b>	0	0	1	2

<b>2;6.19</b>	0	0	0	0
<b>2;7.4</b>	0	0	0	0
<b>2;7.29</b>	0	0	0	0
<b>2;8.11</b>	0	0	0	2
<b>2;8.29</b>	0	0	0	2
<b>2;9.13</b>	0	0	0	0
<b>2;10.3</b>	0	0	0	0
<b>2;10.20</b>	0	0	1	0
<b>2;11.11</b>	0	0	0	0
<b>3;0.0</b>	0	0	0	0
<b>Tot.</b>	<b>1</b>	<b>32</b>	<b>3</b>	<b>10</b>
<b>Tot.</b>	<b>33</b>		<b>13</b>	
<b>Tot.</b>	<b>46</b>			

In Dialect Marco produces fewer utterances than in Italian, only 46, and in the majority of cases he omits the copula (33 cases out of the total amount 46), as shown in graph (43). Also in this case, Marco omits the copula in sentences without the subject (32 \_P), but maybe the cases with omission of the copula in constructions with overt subjects are too few to make reliable comparisons.

**Graph 43: Marco's Dialectal copular contexts**

Graphs (42) and (43) show that Marco produces the copula slightly more in Italian (53%), considering the total amount of contexts (303). Looking at Dialect, the contexts are only 46, and he omits the copula in 72% of cases.

When he realizes the copula, he does it correctly; I mean that no structural or morphological mistakes are present, as shown in (100), (101) for Italian and (102), (103) for Dialect.

100)(s)ono cudute pete poie [=cadute queste foglie] (Marco 2;1.6)

*are fallen these leaves*

*These leaves are fallen down*

101) è pulita (Marco 2;3.14)

*is clean*

*This is clean*

102) a [z]é [=lei è] rotta (Marco 2;2.1)

*It is broken*

103) Dove [z]éo zuzzo? [=dov'è il ciuccio?] (Marco 2;5.9)

*where is dummy?*

*Where is the dummy?*

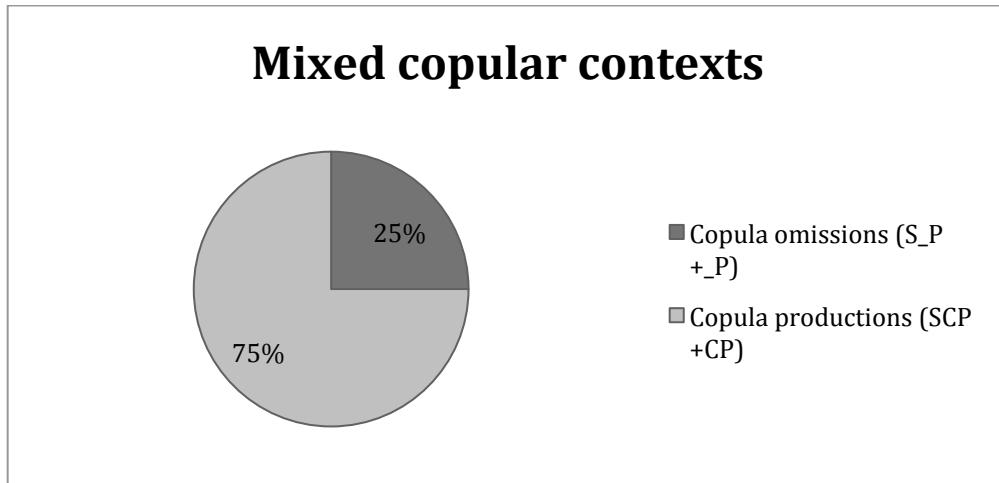

The following table and graph represent the copular contexts found in mixed utterances and the percentage of omission and production of the copula.

**Table 37: Marco's copular contexts in mixed utterances**

	COPULA OMISSION		COPULA PRODUCTION	
	S_P contexts	_P contexts	SCP contexts	CP contexts
2;0.17	0	2	0	0
2;0.29	1	0	0	0

<b>2;1.13</b>	0	1	0	0
<b>2;1.26</b>	0	0	1	1
<b>2;2.11</b>	0	0	1	0
<b>2;3.0</b>	0	0	1	1
<b>2;3.14</b>	0	2	1	1
<b>2;3.29</b>	0	0	0	2
<b>2;4.10</b>	0	1	0	0
<b>2;4.19</b>	0	0	1	0
<b>2;5.9</b>	0	1	5	0
<b>2;6.19</b>	0	0	4	1
<b>2;7.4</b>	0	0	1	0
<b>2;7.29</b>	0	0	1	0
<b>2;8.11</b>	0	0	1	1
<b>2;8.29</b>	0	0	3	0
<b>2;9.13</b>	0	0	2	0
<b>2;10.3</b>	0	0	0	0
<b>2;10.20</b>	0	0	0	0
<b>2;11.11</b>	0	0	0	0
<b>3;0.0</b>	2	1	1	3
<b>Tot.</b>	<b>3</b>	<b>8</b>	<b>23</b>	<b>10</b>
<b>Tot.</b>	<b>11</b>		<b>33</b>	
<b>Tot.</b>	<b>44</b>			

**Graph 44: Marco's copular contexts in mixed utterances**

The copular contexts in mixed utterances that I have found are 44, and in this case the percentage of copula omissions is 25%, most of which are found in  $_P$  contexts. In this case I discovered that the highest number of contexts produced is in SCP: 23. In other words, more than a half of the total amount of constructions analyzed.

As I said before for Italian and Dialect, the realization of the copula is done in a correct way, without structural or morphological mistakes, as shown in (104) and (105).

104) è chiuso desso [=adesso]

(Marco 2;3.0)

*is closed now*

*It is closed now*

105) io sono passùo [=sazio]

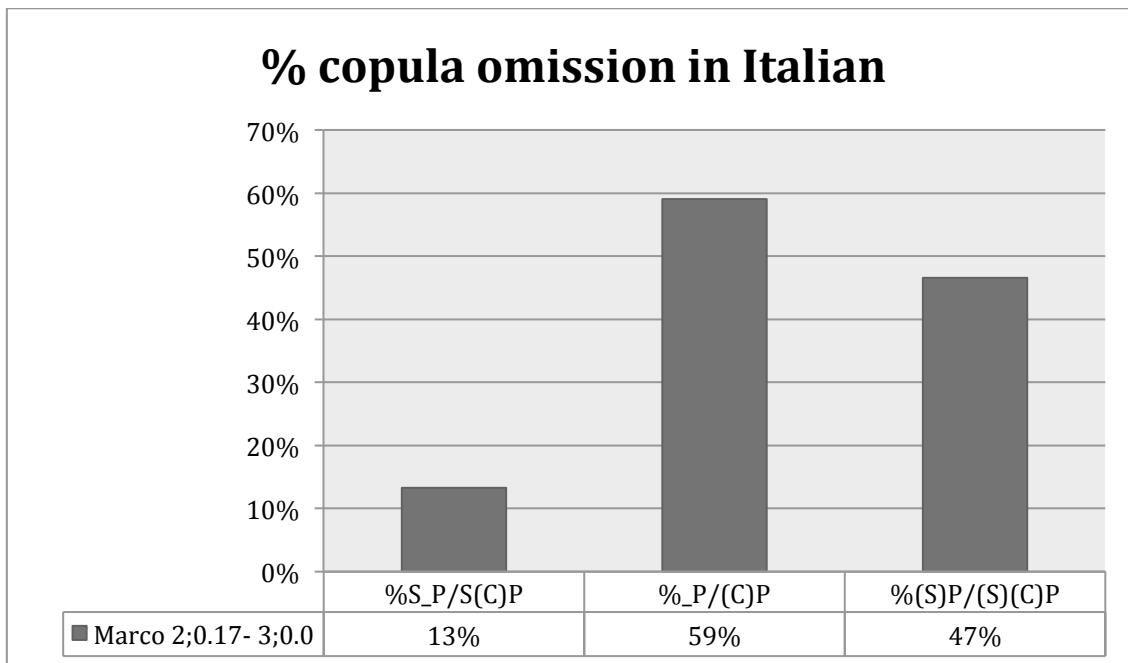

(Marco 2;8.29)

*I am sated*

As for Pietro, I will show the percentage of copula omission in contexts with realized subjects, with non-overt subjects, and the total amount of omission on the total number of copular contexts. I will consider Italian and Dialect separately.

The Italian data are shown in graph (45) and table (38), the Dialect data in graph (46) and table (39).

**Graph 45: percentage of copula omission in Marco's Italian sentences**

**Table 38: percentage of copula omission in Marco's Italian sentences**

	Contexts S_P/S(C)P	% S_P/S(C)P	Contexts _P/(C)P	% _P/(C)P	Contexts (S)_P/(S)(C)P	% (S)_P/(S)(C)P
<b>Marco 2;0.17- 3;0.0</b>	11/83	13%	130/220	59%	141/303	47%

Marco produces 303 copular sentences in Italian, and he omits the verb in almost half of the cases (141/303). This means that copula's omission is a phenomenon accepted by his grammar. Similarly to Pietro (section 5.5.1), he mostly does so in sentences with non-overt subjects (130/220), whereas omissions with overt subjects are quite few (11/83).

Notice however that Marco produces fewer S(C)P contexts compared to those analyzed by Franchi (see table (8), section 4.2.1).

The graph and table below show the data about Dialect.

**Graph 46: percentage of copula omission in Marco's Dialectal sentences**

**Table 39: percentage of copula omission in Marco's Dialectal sentences**

	Contexts S_P/S(C)P	% S_P/S(C)P	Contexts _P/(C)P	% _P/(C)P	Contexts (S)_P/(S)(C)P	% (S)_P/(S)(C)P
<b>Marco 2;0.17- 3;0.0</b>	1/4	25%	32/42	76%	33/46	72%

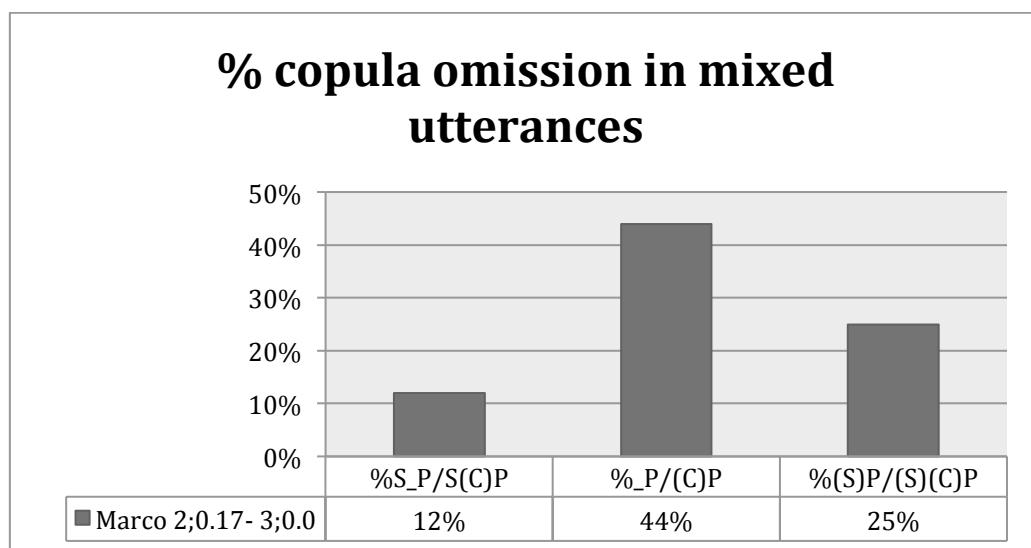

The copular contexts produced by Marco in Dialect are only 46, and the percentage of omission is high (72%) because he omits the copula in 33 cases out of 46. This value is influenced by the contexts with non-realized subjects because they are 42 with 32 omissions. Similarly to Italian, the omission of the copula is

mostly found in \_P contexts, while in constructions with realized subjects, the percentage is lower (25%). Notice, however that the value is based on only 4 contexts, and they are very few to trace a trend.

In any case, the copular construction is available also in Dialect and omission is allowed in Marco's grammar.

The following graph and table show the copular contexts in mixed utterances, i.e. sentences that include words in both Italian and Dialect.

**Graph 47: percentage of copula omission in Marco's mixed utterances**

**Table 40: percentage of copula omission in Marco's mixed utterances**

	Contexts S_P/S(C)P	% S_P/S(C)P	Contexts _P/(C)P	% _P/(C)P	Contexts (S)_P/(S)(C)P	% (S)_P/(S)(C)P
<b>Marco 2;0.17- 3;0.0</b>	3/26	12%	8/18	44%	11/44	25%

The mixed utterances are 44, almost the same as in Dialect, but in this case the omission percentage is lower: only 25%. This is due to the presence of more

contexts with realized subjects, where the percentage of omission is very low (3/26).

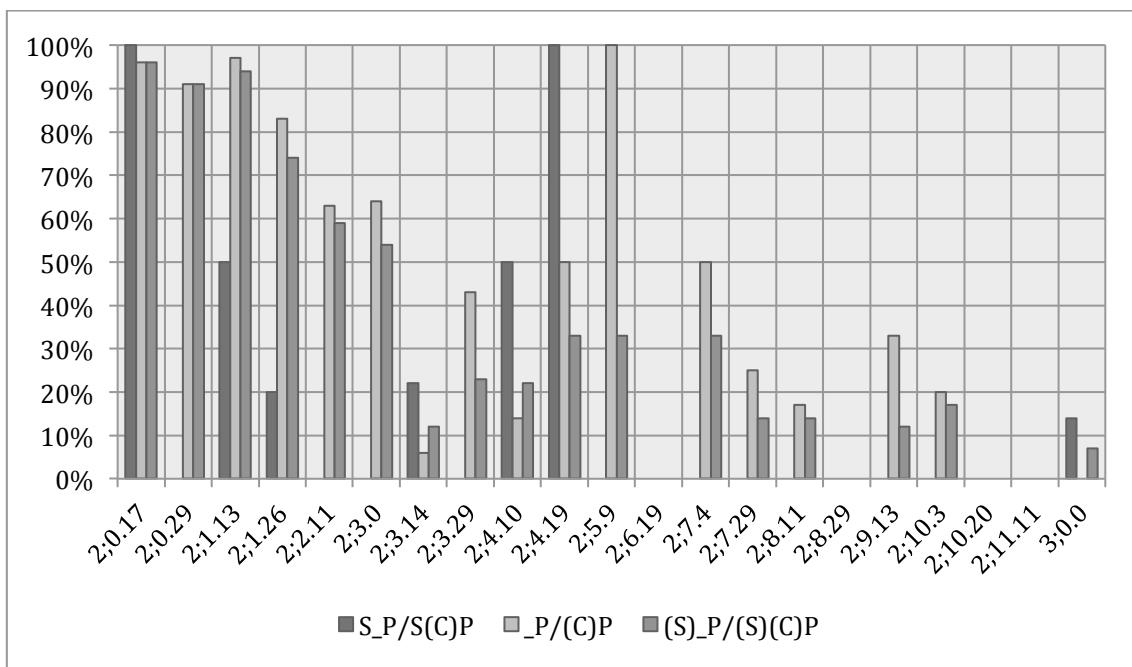

I will now consider the development of copula omission in a longitudinal perspective. In table (41), (42) and (43) the number and percentage of omission are reported in Italian, Dialect, and mixed utterances, respectively. Graphs (48), (49) and (50) are the graphical representations of the values in the tables I just mentioned.

**Table 41: copula omission in number and in percentage for each recording (Marco, Italian)**

<b>3;0.0</b>	1/6	14%	0/6	0%	1/14	7%
<b>TOT.</b>	<b>11/83</b>	<b>13%</b>	<b>130/220</b>	<b>59%</b>	<b>141/303</b>	<b>47%</b>

**Graph 48: copula omission in number and in percentage for each recording (Marco, Italian)**

The omission of the copula is a phenomenon present in Marco's Italian productions. It is relevant in early recordings and then it gradually decreases. Note that at 2;4.19 and 2;5.9, the percentage of the contexts with overt and non-overt subjects jump to 100%, but this must not be taken into great consideration because Marco produces only one structure for each category and therefore the percentage is misleading.

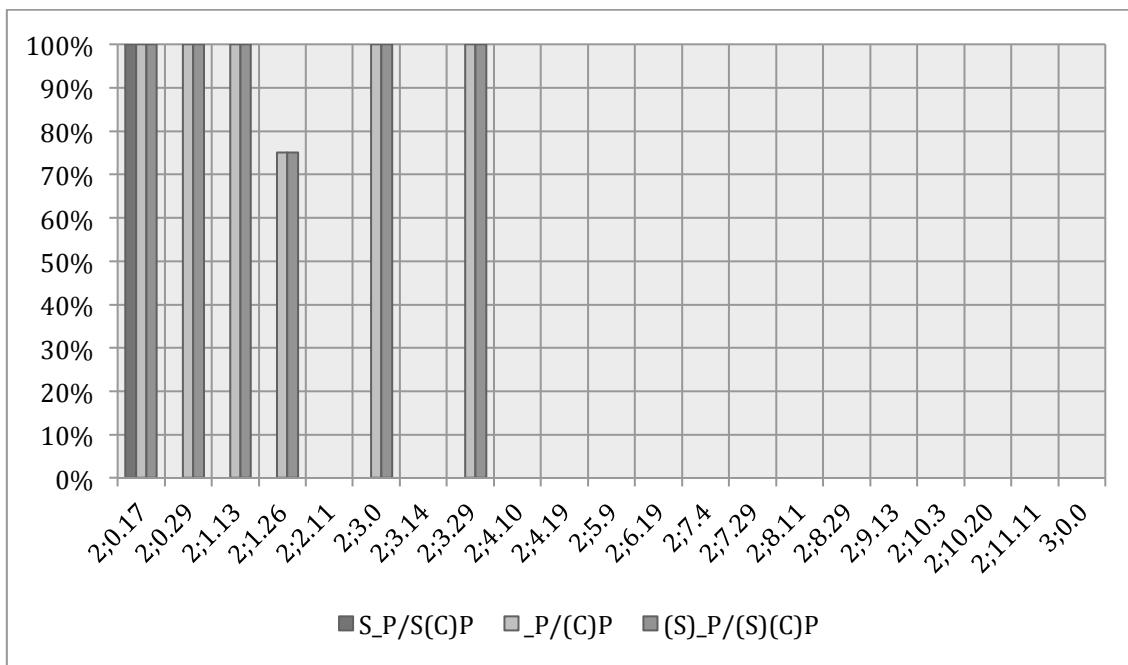

Marco shows a trend similar to Sara, first because he produces only 11 structures with the subject realized and the copula omitted, second because he omits the copula very often in \_P contexts. I therefore suppose that Marco's structure is not truncated at IP when the subject is pronounced.

Below the data for Dialect are reported.

**Table 42: copula omission in number and in percentage for each recording (Marco, Dialect)**

	S_P/S(C)P		_P/(C)P		(S)_P/(S)(C)P	
<b>2;0.17</b>	1/1	100%	8/8	100%	9/9	100%

<b>2;11.11</b>	0/0	-	0/0	-	0/0	-
<b>3;0.0</b>	0/0	-	0/0	-	0/0	-
<b>TOT.</b>	<b>1/4</b>	<b>25%</b>	<b>32/42</b>	<b>76%</b>	<b>33/46</b>	<b>72%</b>

**Graph 49: copula omission in number and in percentage for each recording (Marco, Dialect)**

In Dialect the total number of contexts I have collected is 46 and the omission phenomenon is mostly present in the first recordings and then it suddenly disappears. Note that the moment when omission stops is when Italian becomes the *Stronger Language* (see graph 3, section 2.4), around 2;4.10 and 2;4.19.

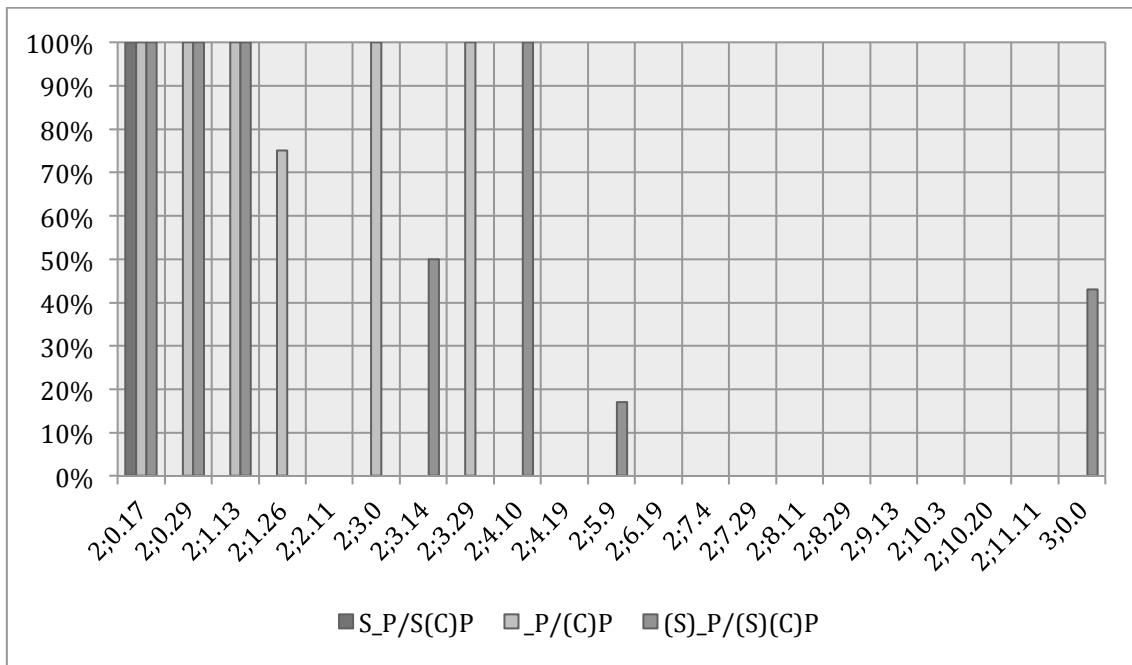

The vast majority of omissions (32/42) are found in contexts with non-overt subjects (\_P). When the subject is pronounced, omissions are very few (1/4). With regard to this case, it must be pointed out that 4 contexts are not enough to trace a reliable trend.

**Table 43: copula omission in number and in percentage for each recording (Marco, mixed utterances)**

	S_P/S(C)P		_P/(C)P		(S)_P/(S)(C)P	
<b>2;0.17</b>	0/0	100%	2/2	100%	2/2	100%

<b>2;6.19</b>	0/4	-	0/1	-	0/5	0%
<b>2;7.4</b>	0/1	-	0/0	-	0/1	0%
<b>2;7.29</b>	0/1	-	0/0	-	0/1	0%
<b>2;8.11</b>	0/1	-	0/1	0%	0/2	0%
<b>2;8.29</b>	0/3	-	0/0	0%	0/3	0%
<b>2;9.13</b>	0/2	-	0/0	-	0/2	0%
<b>2;10.3</b>	0/2	-	0/0	-	0/0	-
<b>2;10.20</b>	0/0	0%	0/0	-	0/0	-
<b>2;11.11</b>	0/0	-	0/0	-	0/0	-
<b>3;0.0</b>	2/3	-	1/4	-	3/7	43%
TOT.	<b>3/26</b>	<b>12%</b>	<b>8/18</b>	<b>44%</b>	<b>11/44</b>	<b>25%</b>

**Graph 50: copula omission in number and in percentage for each recording (Marco, mixed utterances)**

The omission percentage considering mixed utterances is lower in comparison to Italian and Dialect (11/44). The first thing to notice is that omissions in S\_P contexts are very rare (3/26): 1 in the second recording and 2 in the last one. In \_P contexts, the omission percentage does not go higher than 44%. Also in this case, the omission phenomenon stops when Italian becomes the *Stronger Language*.

From now on, I will take only Italian and Dialect into consideration for my investigation, disregarding mixed utterances.

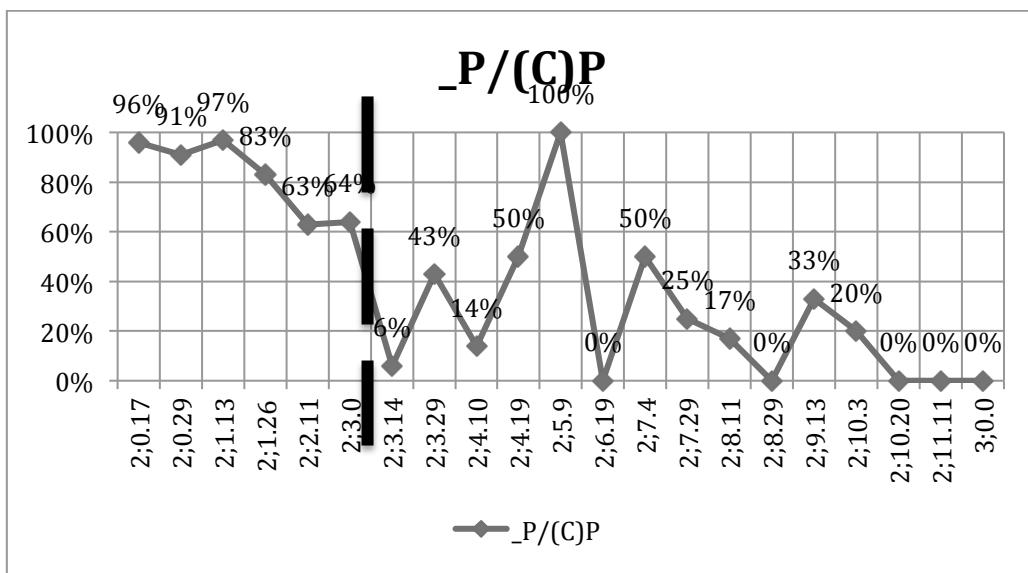

### 5.2.1 Two stages in copula omission

In this section, I will consider if in Marco's productions there are the two *stages* identified by Franchi (2004).

In graphs (51), (52) and (53) the three categories are reported (with overt subjects, with non-realized subjects, and the total amount of omissions) in Italian. A vertical line identifies the *cut* between the *two stages*.

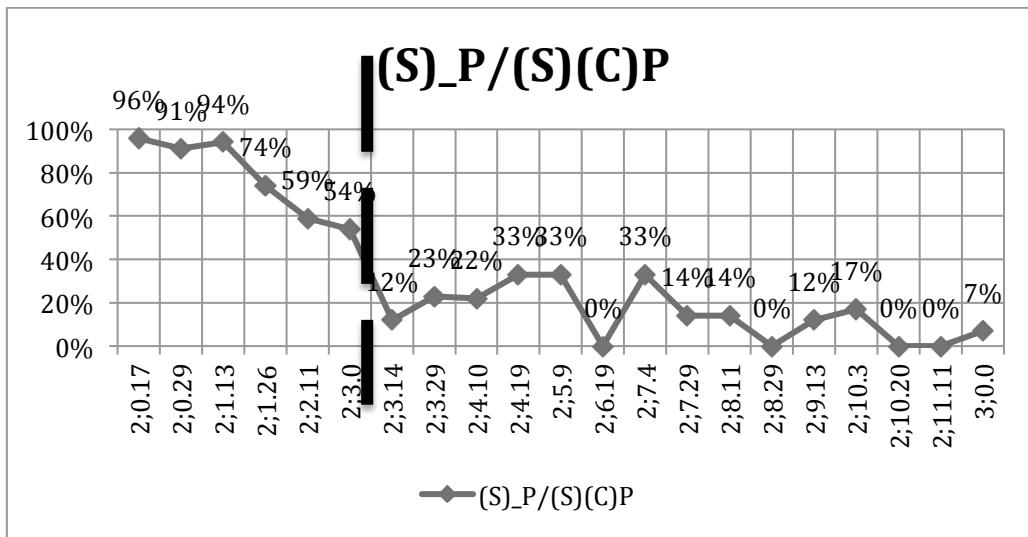

In graph (51) it is easy to notice a sudden and strong change between 2;3.0 and 2;3.14. In the first half of the recordings, the percentage goes from 97% to 63%, while in the second half, the values go from 100% (with only 1 \_P context) to 0%. Also the mean is very different before (83%) and after (24%) the *cut* point. I can therefore say that in Marco's productions with non-realized subjects, the *cut* is between 2;3.0 and 2;3.14.

**Graph 51: percentage of copula omission in utterances with non-realized subjects and the cut point between the two stages (Marco, Italian)**

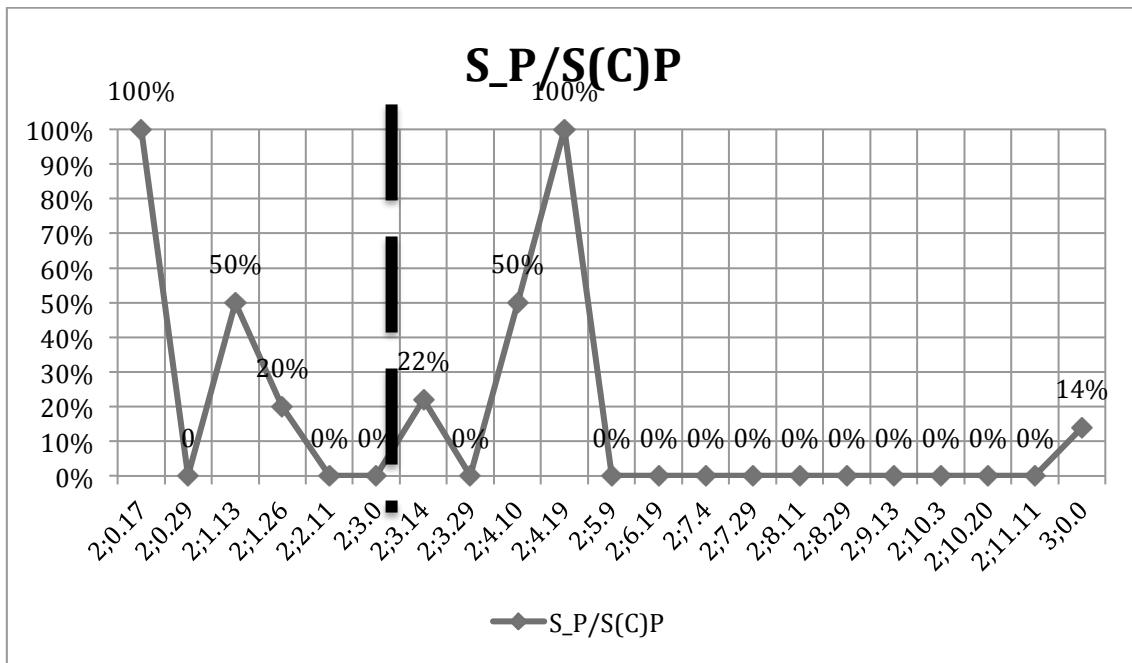

The trend of the total percentage of copula omission is very similar to the previous one, and therefore the cut point has been set in the same place. In the *first stage* the percentage mean is 78%, in the *second stage* is 15%.

**Graph 52: total percentage of copula omission and the cut point between the two stages (Marco, Italian)**

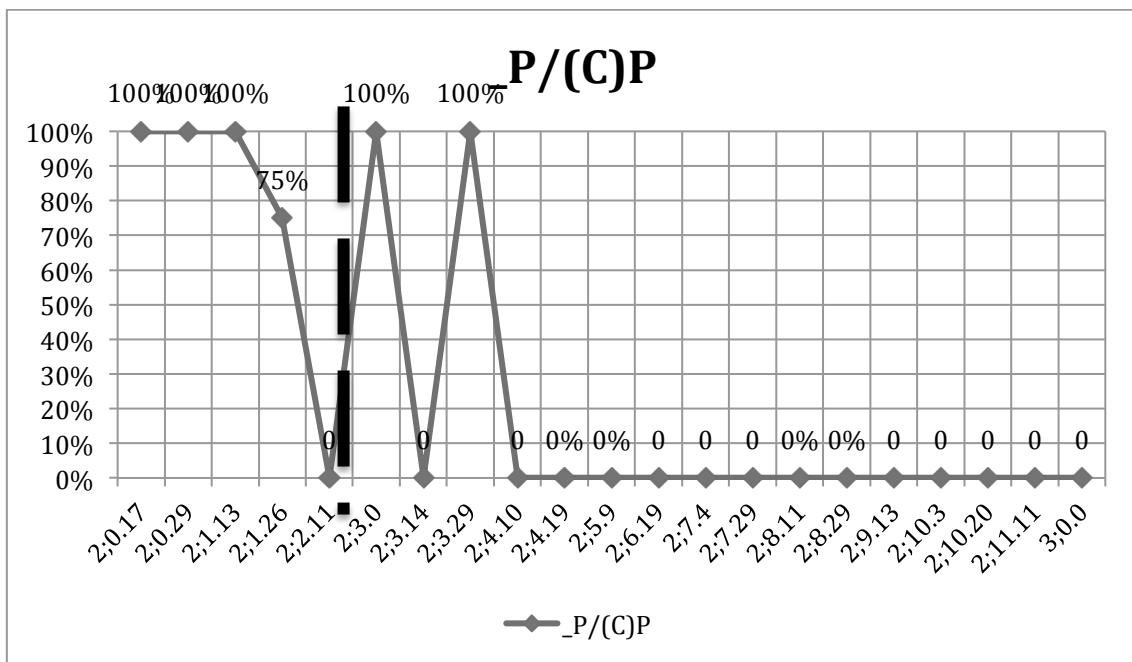

The "pure" category, that is the group with overt subjects, shows a trend that confirms the existence of the two stages hypothesized by Franchi (2004), because from 2;3.0 on, Marco's percentage of omissions is almost always 0% and when he produces omissions, he does it in just one or two contexts. The *cut* point is therefore placed at the same age as the other cases, more precisely between 2;3.0 and 2;3.14.

**Graph 53: contexts with overt subjects and the cut point between the two stages (Marco, Italian)**

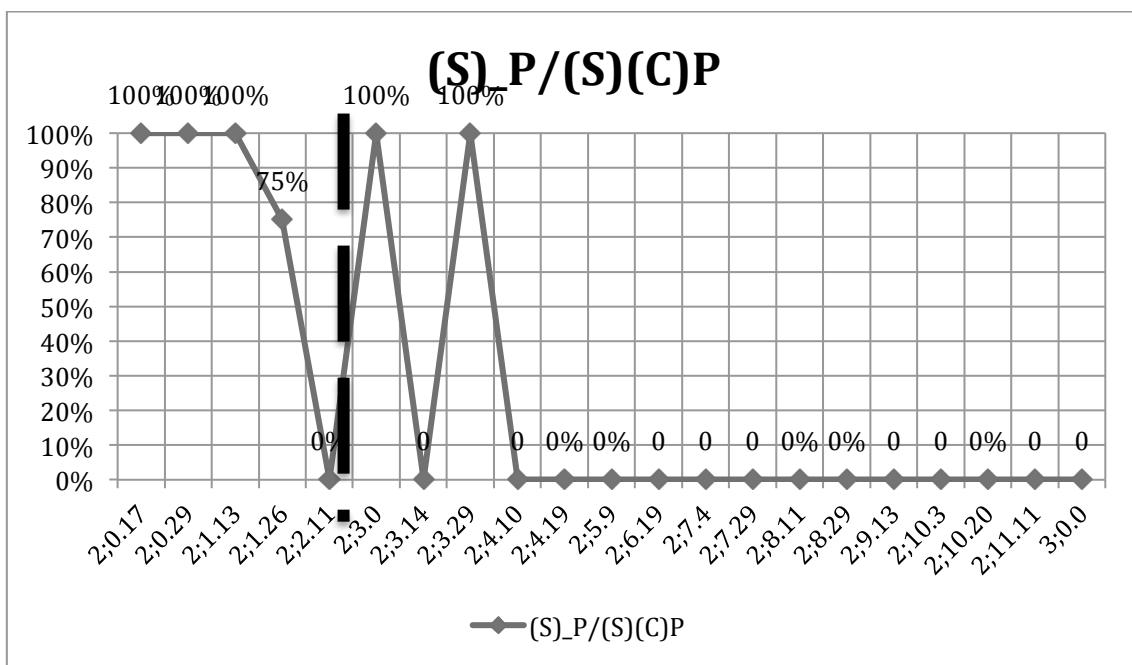

The graphs below concern the Dialect's data. The sentences with non-overt subjects show a change between 2;2.11 and 2;3.0 because after that moment the cases of omission are just 1 in each recording (2;3.0 and 2;3.29). Consequently, I located there the *cut* between the *two stages*. It is placed one month earlier than the one found in Italian and is present in the same moment in the following graph, which is clearly influenced by the \_P context, since it includes most cases of omission (42/46).

**Graph 54: percentage of copula omission in utterances with non-realized subjects and the cut point between the two stages (Marco, Dialect)**

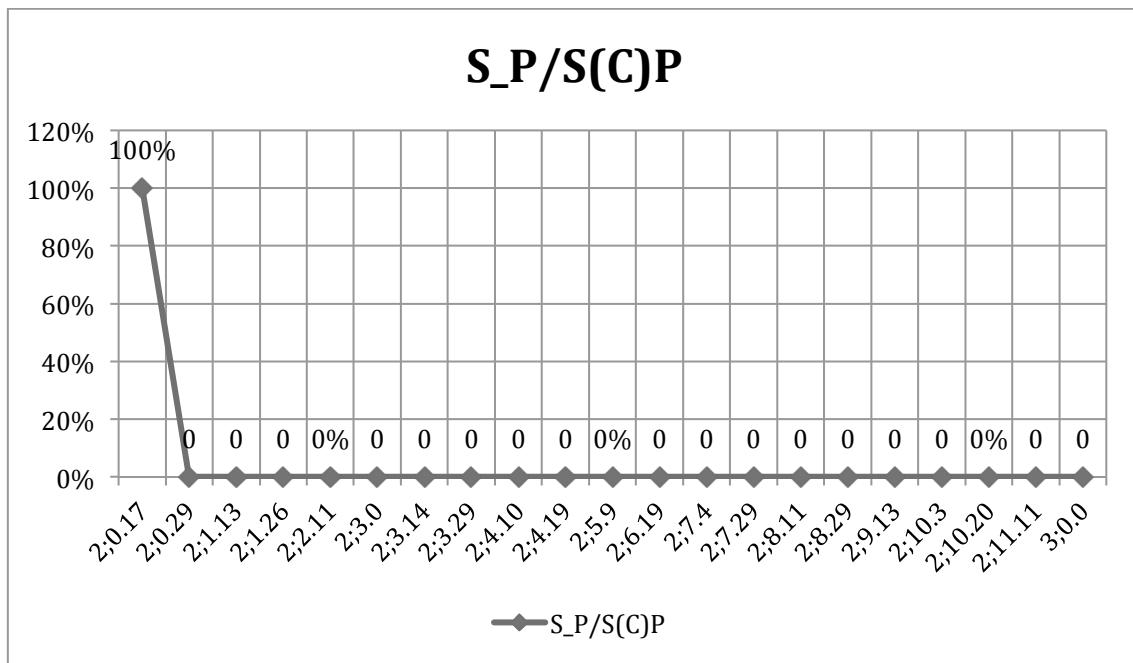

**Graph 55: total percentage of copula omission and the cut point between the two stages (Marco, Dialect)**

I have collected only 4 sentences in the group of contexts with overt subjects and the unique case of omission is produced in the first recording. This is not enough to trace a trend and I have therefore supposed that the *cut* point identified in the previous graphs is the one valid for Dialect and probably also for the contexts with overt subjects.

**Graph 56: contexts with overt subjects and the cut point between the two stages (Marco, Dialect)**

### 5.2.2 How repetition affects Marco's productions

In this section I will consider how the repetition phenomenon has influenced Marco's copular contexts that I have analyzed until now. In table (44) I have reported the number of repetition that he makes in Italian in each recording, when he produces copular structures. It is clear that they are very few: only 21 out of 303 copular contexts. All repetitions are produced in the \_P context and in the first recordings. There are no repetitions in other contexts.

**Table 44: cases of repetition in Marco's Italian corpus**

	COPULA OMISSION		COPULA PRODUCTION	
	S_P contexts	_P contexts	SCP contexts	CP contexts
<b>2;0.17</b>	0	<b>5</b>	0	0
<b>2;0.29</b>	0	<b>7</b>	0	0

Marco produces very few repetitions, therefore the percentage of omission in both Italian and Dialect are not influenced by this phenomenon. His repetitions are all \_P structures. He never repeated a structure with overt subjects or overt copulas. This means that all copula's productions are realized in free productions.

### **5.2.3 Effects of grammatical or semantic class of the predicate on copula omission**

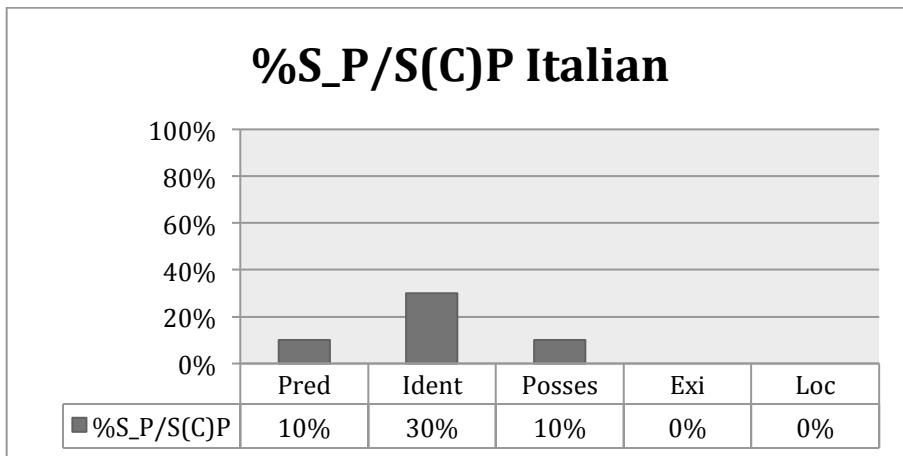

In this section, I followed Franchi's classification, described in 4.1.3.1 (see graphs (11), (12) and (13)) in order to examine whether Marco omits the copula more often in some semantic categories than in others.

In graph (57) Marco's copula omissions in Italian contexts with non-realized subjects are reported (\_P/(C)P), whereas graph (58) shows the Italian constructions with overt subjects (S\_P/S(C)P).

**Graph 57: percentage of copula omissions in contexts with non-overt subjects (Marco, Italian)**

**Graph 58: percentage of copula omission with overt subjects (Marco, Italian)**

**Table 48: number and percentage of copula omission in each category**

	-P/(C)P		S_P/S(C)P	
	Total	Percentage	Total	Percentage
<b>Predicative</b>	26/89	30%	5/38	10%
<b>Identificative</b>	92/101	90%	5/18	30%
<b>Possessive</b>	3/9	30%	1/11	10%
<b>Existential</b>	2/7	30%	0/14	0%
<b>Locative</b>	5/12	40%	0/7	0%

The examples below show the omissions in each category.

*Predicative*

106) (è) pocco [=sporco] (Marco 2;1.13)

*(It is) dirty*

107) (è) tutta poca pella [=sporca quella] (Marco 2;3.14)

*all dirty that one*

*That one is completely dirty*

*Identificative*

- 108) scimmia (Marco 2;3.29)  
*(This one is a) monkey*

- 109) que(s)ta (è) la mucca (Marco 2;1.26)  
*This one (is) the cow*

*Possessive*

- 110) (è) del nonno Gianni (Marco 2;4.19)  
*(is) of the grandfather Gianni  
(It is) grandfather Gianni's*

- 111) La ruspa (è) mia (Marco 2;4.19)  
*The bulldozer (is) mine*

*Existential*

- 112) (c'è) la luna p(i)ena (Marco 2;1.13)  
*(there is) the full moon*

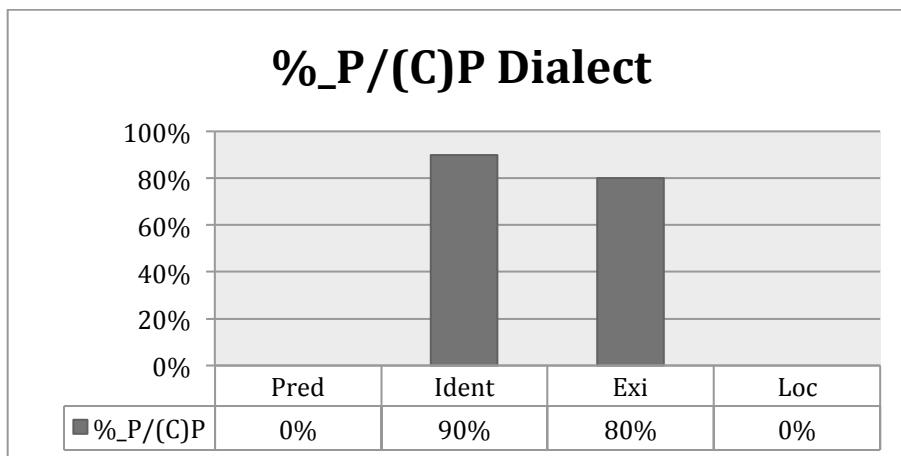

*Locative*

- 113) (è) dento [=dentro] là (Marco 2;0.17)  
*(it is) inside there  
It is there inside*

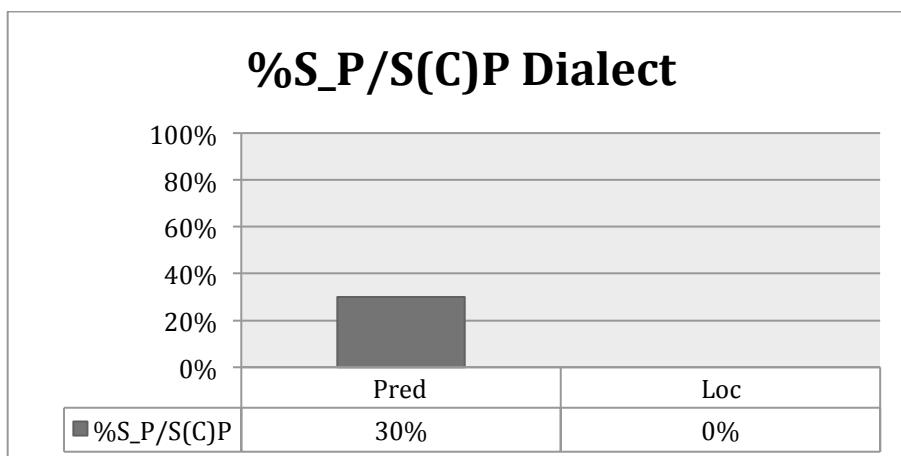

The results for Italian show that the percentage of omission is unpredictable and the semantic class does not influence it.

Graph (58) and (59) report the data from the Dialect.

**Graph 59: percentage of copula omissions in contexts with non-overt subjects (Marco, Dialect)**

**Graph 60: percentage of copula omission with overt subjects (Marco, Dialect)**

**Table 49: number and percentage of copula omission in each category**

	-_P/(C)P		S_P/S(C)P	
<b>Predicative</b>	0/4	0%	1/3	30%
<b>Identificative</b>	27/29	90%	0/0	-
<b>Possessive</b>	0/0	-	0/0	-

<b>Existential</b>	4/5	80%	0/0	-
<b>Locative</b>	0/3	0%	0/1	0%

In Dialect, I found omissions in only 3 categories: *Identificative*, *Existential* and *Predicative*. The omission value in the first category is quite high (90%) and in Dialect Marco omits the copula also in existential constructions.

Below, the examples show the omissions in Marco's sentences.

#### *Identificative*

- 114) (zé) a bissi [=bicicletta] (Marco 2;0.29)  
*(it is) a bicycle*

#### *Existential*

- 115) el nono [=il nonno] (Marco 2;1.13)  
*(there is) the grandfather*

#### *Predicative*

- 116) (zé) uto potto [=è tutto a posto] (Marco 2;0.17)  
*(is) everything all right*  
*Everything (is) all right*

My results do not confirm Becker's (2000, 2004) hypothesis (see 4.1.3) because Marco omits the copula more often in nominal predicates, than in locative ones.

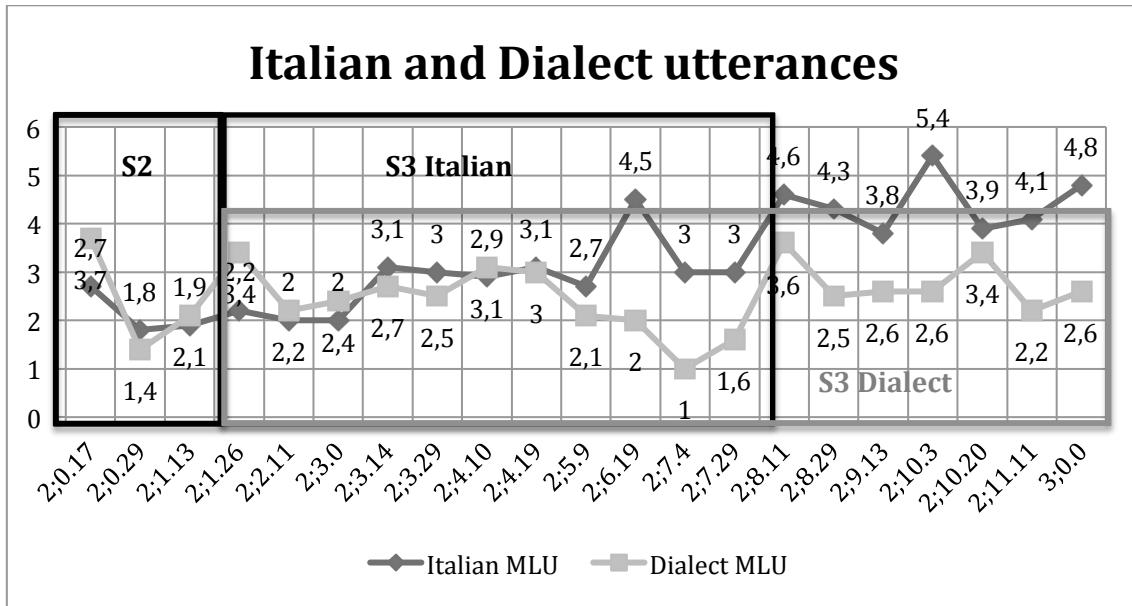

#### **5.2.4 Focusing on agreement**

In this section, I will analyze Marco's copula production, comparing his data with the results in Caprin and Guasti (2006). In graph (61) I divided his MLU into the three stages identified by Caprin and Guasti (2006) and described in 4.1.2.

Note that Marco's MLU never goes under 1,4 (except once in 2;7.4), therefore there is no "MarcoS1" in my data. In order to follow Caprin and Guasti's

methodology, I had to divide "Marco S3": one for Italian and one for Dialect, which lasts until the end of the recordings because the MLU is almost always below 3.

**Graph 61: Marco's MLU divided into Caprin and Guasti's groups**

In table (50) I have listed all the copula realizations divided into two groups: "Marco S2 Italian", and "Marco S3 Italian".

**Table 50: number of correct/wrong forms in Marco's corpus, Italian**

ITALIAN	Correct forms	Wrong forms	Total structures
Marco S2	5	/	5
Marco S3	33	3	36
<b>Tot.</b>	<b>38</b>	<b>3</b>	<b>41</b>

In Italian, Marco produced 41 copulas: in the first stage, there are only 5 realizations and in the second one 33, with only 3 mistakes. These errors consist in

the use of the 3<sup>rd</sup> person singular instead of the 3<sup>rd</sup> plural. Marco produces 9 plural forms and 6 of them are correct (117).

117) (s)ono cudute pete poie [=cadute queste foglie] (Marco 2;1.26)  
*are fallen these leaves*  
*These leaves are fallen*

In Dialect (table 51) there are even fewer copula productions (12), but no mistakes are found. Marco never produces plural forms.

**Table 51: number of correct/wrong forms in Marco's corpus, Dialect**

DIALECT	Correct forms	Wrong forms	Total structures
Marco S2	/	/	/
Marco S3	10	/	10
<b>Tot.</b>	<b>10</b>	/	<b>10</b>

The number of contexts analyzed for Marco is very low in comparison with the structures analyzed by Caprin and Guasti (2006), but very few mistakes can be observed.

### 5.2.5 Declaratives versus Wh contexts

This section is devoted to the analysis of the interrogative contexts produced by Marco.

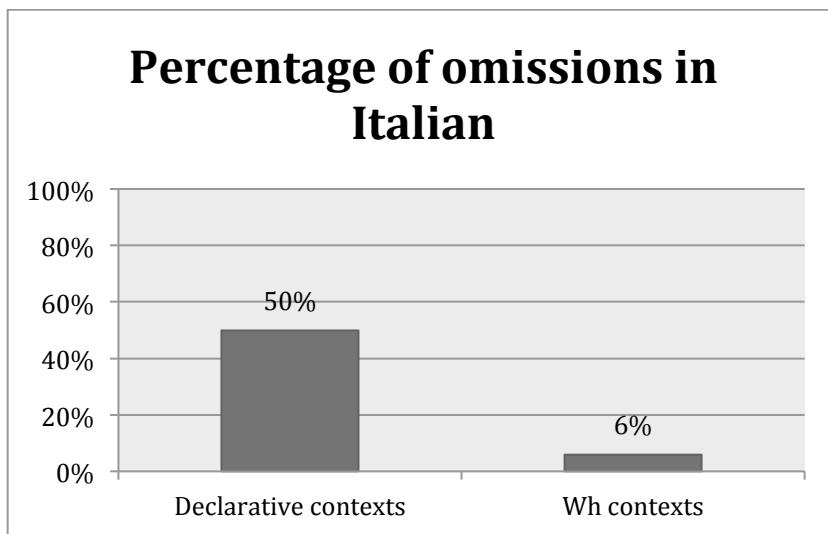

27 interrogative sentences were collected, 19 produced in Italian (table (52)) and 8 in Dialect (table (53)).

**Table 52: copula omission in Wh contexts (Marco, Italian)**

	Contexts	Omissions	Productions	% Omission
<b>2;0.17</b>	0	0	0	-

<b>TOT.</b>	<b>8</b>	<b>0</b>	<b>8</b>	<b>0%</b>

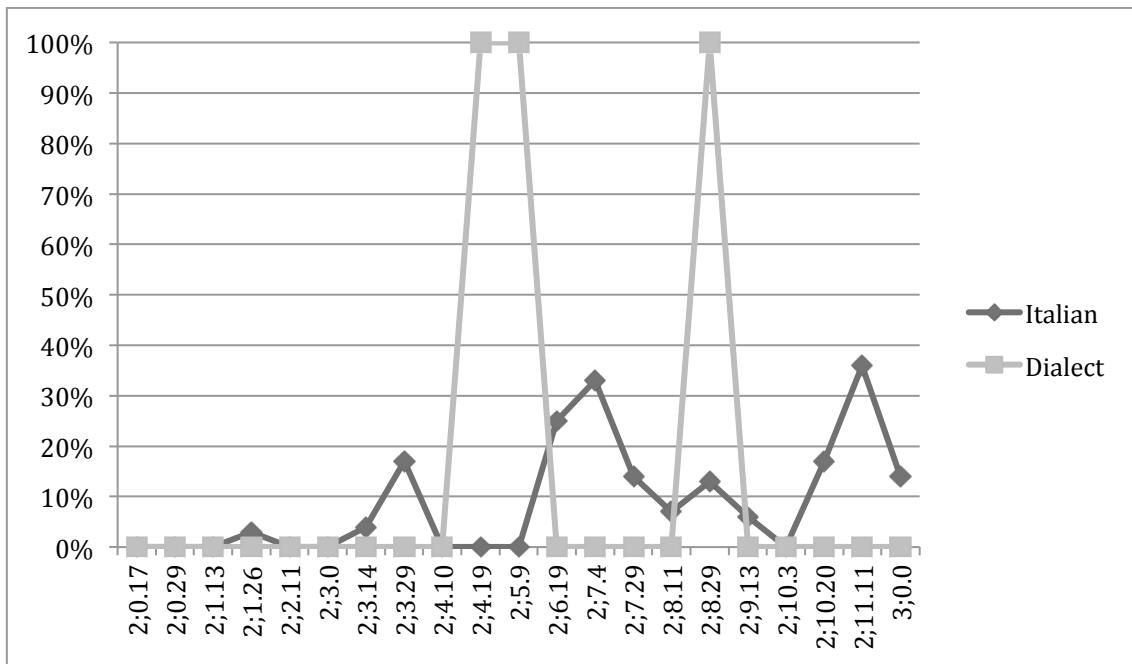

**Graph 63: percentage of omissions in Wh contexts versus declarative sentences (Marco, Dialect)**

The amount of contexts collected in Marco's corpus is not very consistent, but the trend is absolutely clear: he omits the copula in only 1 context out of 27, this happens in Italian and in the fourth recording, therefore very early. In Dialect, he never omits the copula in interrogative sentences, whereas in declarative constructions the omission reaches 87%. In conclusion, Marco's grammar does not allow omission of the copula in Wh contexts.

Graph (64) shows that there is not a gradual growth of interrogative sentences, he actually produces very few of them.

**Graph 64: percentage of interrogative sentences in relation to the total amount of copular contexts for each recording**

The table below (54) shows the percentage of copula omission in declarative contexts. I have also reported table (41), repeated here as (54b), to compare the percentages of all contexts together more easily (Declaratives + Wh)

**Table 54: percentage of copula omission in declarative contexts (Marco, Italian)**

<b>3;0.0</b>	1/6	14%	0/6	0%	1/14	7%
<b>TOT.</b>	<b>11/83</b>	<b>13%</b>	<b>130/220</b>	<b>59%</b>	<b>141/303</b>	<b>47%</b>

Table (54) confirms that the omission trend in Marco is similar to Sara's, as I said before. He rarely omits the copula when the subject is pronounced (16%), and he often omits it when the subject is not realized (60%). The value for sentences with overt subjects is lower compared to Franchi's results (table 1 and 2), while in contexts with non-overt subject and the in total amount of omissions Marco's percentage is similar to the results in Franchi (2004, 2006).

### 5.2.6. Articles

In this last section about Marco, I will analyze his productions of articles in the copular contexts I have considered so far.

I have collected all the utterances where the article would have been realized in an adult grammar, and I have kept them divided into the 4 copula's categories.

In Italian, the contexts where the article should be realized are 141, and Marco produces them in 85 cases. In Dialect, the situations requiring the article were only 32, and he produced it 28 times. In (118), (119), (120) and (121) some examples of Marco's omission and production of the articles are reported.

*Articles omission*

118) ITALIAN

Olive	(Marco 2;3.0)
<i>olives</i>	
<i>The olives</i>	

119) DIALECT

Toia [=foglia]	(Marco 2;0.17)
<i>leaf</i>	
<i>The leaf</i>	

*Articles production*

120) ITALIAN

Dov'è la macchina?	(Marco 3;0.0)
<i>Where is the car?</i>	

121) DIALECT

A muca [=mucca]	(Marco 2;1.26)
<i>The cow</i>	

The percentage of articles' productions in Italian and in Dialect is quite different (table (55)). The value in Dialect is more similar to Sara's value in Italian (89%) even though the contexts collected were few and only in \_P and SCP contexts. In other words, for S\_P and CP I could not find any context were the article was required.

**Table 55: percentage of articles' use in Italian and Dialect**

	ITALIAN	DIALECT
<b>S_P</b>	63%	-
<b>_P</b>	51%	90%
<b>SCP</b>	89%	0%
<b>CP</b>	83%	-
<b>Tot.</b>	<b>60%</b>	<b>88%</b>

In conclusion, at this stage Marco has not developed a full competence of the article, yet.

### 5.3 Summing up

In this chapter I analyzed various aspects of the copula produced or omitted by Pietro and Marco, two bilingual children.

First of all, I have presented the copular contexts I collected for each of them. For Pietro, I found 652 contexts in Italian (352 are omissions and 300 are productions), 83 contexts in Dialect (51 omissions and 32 realizations) and 14 contexts in mixed utterances (6 omissions and 8 productions of the copula). In Marco's corpus, I counted 303 copular contexts in Italian (141 omissions and 162 productions), 46 constructions in Dialect (33 omissions and 13 productions), 44 contexts in mixed utterances (11 omissions and 33 productions). I noticed that Marco produces very few S\_P cases (11), compared to the \_P contexts (130), probably because his structure is complete and full, on the contrary Pietro omits the copula in 46% of cases with overt subjects, this means that his structure is truncated at IP.

Then I considered copula omission from a longitudinal perspective and I observed that in Pietro and Marco, in both their languages, the percentage of omissions in contexts with realized subject (S\_P/S(C)P) is never higher than 26%, whereas in contexts with non-overt subjects, the value may be up to 76%. The omission is more present at the beginning and then it gradually reduces.

Following Franchi (2004), *two stages* can be identified.

Considering Pietro, I located the *cut* between the *two stages* between 2;1.25 and 2;2.7 for Italian and between 2;1.8 and 2;1.25 for Dialect. Analyzing Marco I located the *cut* between 2;3.0 and 2;3.14 for Italian and a little bit earlier for Dialect (2;2.11 and 2;3.0). They are all very similar to the *cut* found by Franchi (see table (10)).

Since I could not access the corpus of Pietro, I analyzed the repetition cases only for Marco. I found that the repetitions are few (21 in Italian and 4 in Dialect) and all produced in \_P contexts, this means that this phenomenon does not influence Marco's production very much.

I observed if there is a particular trend in copula omission depending on the semantic class. It emerged that Pietro and Marco's omissions are mostly found in the *Predicative* and *Identificative* copular constructions.

Concerning the agreement between the subject and the copula, I found that both children produce few cases of wrong forms (12 Pietro and 3 Marco). When it happens, they both use the 3<sup>rd</sup> person singular instead of the plural one. This could be an influence from their Dialects, because in both of them, the plural form is not different from the singular one (see 3.1 and 3.2).

I then analyzed the interrogative sentences, and I found that the percentage of omission of the copula is very low. In Italian, Pietro omits the copula in 5% of cases, and in Dialect 13% (but the Wh contexts collected here were only 9), and Marco's omission in Italian are 6% (i.e. 1/out of 19 contexts) and in Dialect 0% (0 out of 8 contexts).

In the last part of the chapter, I have examined the production of articles in copular contexts: Pietro produces them in 25% (Italian) and 28% (Dialect) of the cases, while Marco is a little bit more competent: 60% in Italian and 88% in Dialect.

# 6. Conclusions

In this thesis I have analyzed the productions of three children: Sara, who is monolingual Italian, Pietro who is bilingual and speaks both Italian and the Dialect of Cittadella, and Marco, who is bilingual too, speaks Italian and the Dialect of Rosà. Sara was recorded from age 1;9.7 to 2;4.20, Pietro from age 1;6.27 to 2;8.19 and Marco from age 2;0.17 to 3;0.0.

In chapter 2, I studied the three children's MLU, following the *Ivy Hypothesis* (Bernardini and Schlyter, 2004) and I noticed that the MLUs are very similar in the three children and in both Pietro and Marco the *Stronger Language* is Italian. In Pietro's MLU, the moment where the Dialect MLU and the Italian one start to grow differently is at 1;10.8, some months before Marco (2;4.19).

In chapter 3, I have described the morphology and the distribution of the copula in both Dialects considered in my research (Cittadella and Rosà).

Chapter 4 and 5 concerned the analysis of the copula in Sara, Pietro and Marco. I first collected all the copular contexts that they produced: 282 for Sara, 652 in Italian and 83 in Dialect for Pietro, 303 in Italian and 46 in Dialect for Marco. In all of them, omission of the copula is found: 42% Sara, 54% in Pietro's Italian, and 61% in Pietro's Dialect, 47% in Marco's Italian and 72% in Marco's Dialect.

Analyzing their omissions deeper, I noticed that the percentage decreases as they grow up and it is higher in contexts with non-overt subjects, whereas the omission percentage in constructions with realized subjects is quite low in Sara and Marco. I argued that this suggests a tendency to produce the copula when the structure is more complex (due to the presence of the subject). In other words, when the subject is realized, Sara and Marco use the full structure (CP included). Pietro omits the copula in 46% of cases with declarative overt subjects, this means that his structure is truncated at IP.

In all the children, I located the cut between the *two stages* (Franchi, 2004): between 1;10.5 and 1;10.12 for Sara, for Pietro 2;1.25 - 2;2.7 in Italian and 2;1.8 - 2;1.25 in Dialect, for Marco 2;3.0-2; 3.14 in Italian and between 2;2.11 and 2;3.0 in Dialect. Sara's cut between the *first* and the *second stage* is very early, nonetheless, she showed a quicker development in acquisition compared to the other children, including those analyzed in Franchi (2004).

I then investigated if the semantic classes influenced omission of the copula and I noticed that the highest percentage of omissions is in the *Predicative* and *Identificative* categories.

The agreement of the copula and its subject is generally well produced, few cases of wrong forms are found (8 in Sara, 12 in Pietro and 3 in Marco), and when it happens it is because they use the 3<sup>rd</sup> singular form instead of the 3<sup>rd</sup> plural one.

The percentage of omission in interrogative contexts is low: 6% in Sara, 5% in Italian and 13% in Dialect for Pietro, 6% in Italian and 0% in Dialect for Marco.

The last thing I observed was the production of the articles in the copular contexts and I concluded that Sara has a full competence because her production percentage is 89%, whereas Pietro (25% Italian and 28% Dialect) and Marco (60% Italian and 88% Dialect) are not fully competent yet.

Nr.	ITALIAN
2	guadda [=guarda]
3	guarda tutti in cerchio
4	guarda
5	guarda
6	cosa c'è?
7	vuoi uscire?
8	vuole uscire
9	ecco
10	lui
11	perchè vuole uscire la Minù
12	brutti
13	questi
14	io faccio il cerchio qui
15	questo
16	questo è uguale
17	questo sì
18	è uguale
19	guadda [=guarda]
20	è quello
21	si questo
22	questo uguale
23	ciao
24	adda [=guarda]
25	quello giallo
26	anche questo ce l'ha giallo
27	guadda [=guarda] uno
28	questi li
29	guadda [=guarda]
30	guadda [=guarda] come

RECORDING 12: DATE 25.01.2007
